

RIXML Standards Suite v3.0

DRAFT Release Notes and Data Dictionary

Based on Release Candidate 4

Release candidate released 18 December 2024

Documentation version RC4.1

December 18, 2024

Introduction

Purpose

We have compiled this document to provide an overview of the RIXML Standards Suite v3.0 release candidate, explain the new structure, and provide high-level information regarding the changes between v2.5 and this release candidate. Please note:

- We have tried to provide the information in this document in a way that makes it understandable to readers with a variety of levels of technical expertise. Our goal was to make it as useful for those with little understanding of how XML works as those with a deep understanding. See the XSD files themselves to see specifics on any individual tag or tag set.
- This document is definitely a draft; the goal is to provide enough information to the Testing Task Team to allow them to begin testing the release candidate.
- This document is focused on the RIXML Research Standard; we will be adding information about the other standards in the suite in future versions.
- The explanatory information at the start of each section is largely new; however, note that the definitions for individual elements and attributes have been carried over from the v2.5 documentation. The Taxonomy and Documentation Task Team will be updating these concurrently with the Testing Task Team's testing initiative.
- The definitions for the individual enumerations have been omitted in this draft. The Taxonomy and Documentation Task Team will be updating these concurrently with the Testing Task Team's testing initiative.

Getting involved

We encourage all RIXML member firms to get involved in testing the RIXML Standards Suite v3.0 release candidate. Contact RIXML Director Deirdre Goldenbogen (Deirdre.Goldenbogen@RIXML.org) to be added to the Transition Team Working Group email distribution list, which we use to announce updates and meeting dates for all aspects of the transition process, including testing.

Providing feedback

As you review this document and begin testing the RIXML v3.0-RC4 release candidate, we encourage you to let us know of any questions, roadblocks, or challenges you encounter.

You can provide that feedback by emailing Deirdre.goldenbogen@rixml.org.

Disclaimer

The information contained in this document was developed by participating RIXML member firms with input from RIXML member firms and others. It does not necessarily represent the views or opinions of RIXML or any individual member firm. RIXML and its members hereby disclaim any and all liability resulting from all claims, losses or damages, whether direct, indirect, incidental, or consequential arising from any and all use of these Standards. RIXML is not responsible for any errors or omissions in the information contained in this document. RIXML and its affiliates make no warranties or representations and disclaim all express, implied and statutory warranties of any kind to any party resulting from the use of these Standards.

Overview

High-level overview of the Research Standard

Each of the tags in the RIXML Research Standard exists to accomplish a specific task. Some exist to provide information about authorship, some exist to provide information about the research files the tagging is describing (or the URL that contains the research content), others exist to convey information about what the research item is *about* – what companies, countries, industries, etc. are being discussed.

We thought it would be helpful to provide a high-level overview of the tags used in the Research standard grouped by the task they perform. This section does not fully describe any individual tag or tag set, and it does not present the tag sets in the order in which they appear in the Research schema file, but it does give a sense of how the tag sets generally work and what function they serve. The remainder of the document will provide details on each tag and tag set.

Tag sets used in RIXML Research v3.0

TASK 1:

Describe the RIXML Research tagging file

The file that contains the RIXML tagging that describes a research item (a research report, model, podcast, etc.) is called a *RIXML Research Instance Document*.

An Instance Document contains both information about the research item being described and about the instance document itself.

To describe the instance document, a publisher will

1. provide a unique identifier
2. indicate the date and time the instance document was created
3. indicate the language used in the content of the instance document (this is usually the same as the language used in the research item, but not always)
4. indicate the initial publishing action or add a new publishing action to indicate the reason this instance document is being published, thereby providing a timestamped history of this instance document.

TASK 2:

Provide information about the content that this RIXML instance document is describing

Next, a publisher will:

1. indicate when the research item this RIXML instance document is describing was created.

Note the difference between the createDateTime from step 1:

createDateTime = when the RIXML instance document (tagging file) was created

publicationDateTime = when the content this RIXML instance document is describing (the research report, model, or other research item) was published

2. describe the file(s) that make up the research item this RIXML record is describing: the file name, length, etc.

Resource = the file or URL that contains the actual research content

3. provide the entitlement information for this research item, if desired.

4. add disclosures, disclaimers, and copyright information.

TASK 3:

Begin describing the research item itself

These tags provide information about the research item itself – what form it takes, who is publishing it, and what it is called. The publisher will:

1. generally describe the research item and the research approach used to create it.

2. provide title and summary information.

3. add flags (if needed).

4. provide authorship information.

TASK 4:

Describe the subject matter of the research item

This is the tagging that explains what the research item is “about” – including indicating what the research item is mostly about as well as conveying the companies, industries, topics, etc. covered in the research item. This two-step process includes:

1. defining the main focus of the research item.

2. adding topic-related tags to describe the material covered.

The exact tags used will vary based on the focus.

Certain tags will be required, but publishers frequently add additional tags to further describe the content covered in the research item.

	Disclaimer	(0..1) string		
2	Copyright	(0..1) string		

TASK 5:

Add special-use tags

Although the following are not required for all research items, the following will be used when applicable:

1. Use the ActionList tag set to report a weighting, rating, coverage, or estimate change.
2. To include event information in a Research item, use the EventDetails tag set.

(Note: we strongly recommend using the Interactions standard to describe events, as it has been designed specifically for this task; these tags are intended to convey a small amount of event-related data that might be relevant in the context of a research item.)

3. Add *Expected search terms*.

This allows a publisher to add search terms a user is likely to use when looking for the content in this report, but that is not captured elsewhere in the tagging.

TASK 6:

Make connections

RIXML v3.0 significantly enhances the ability to make connections between and among research items.

1. The new Component tag list allows tagging to be added to describe individual sections and components of a research item, such as charts, chapters, or sections.
2. If the research item is part of a series, use the EpisodeList tag set to describe this episode, then use the new SeriesInventory standard to describe the series and collect the episodes.
3. Use the RelatedProduct tag set to provide a reference from this research item to one or more related research items or interaction records.

The remainder of this document describes the above tag sets.

The Research Product

What's the same / what's different

- The main schema file for the Research standard has always been fairly lightweight, housing the framework for describing an individual research item and pointing to the common schema file for the bulk of the tag definitions and to the enumerations list for the valid terms for the elements and attribute tags that use them. In v3.0, the structure of the main Research standard has been flattened – made even more streamlined - with many elements moved to the top level of the standard.
- The top-level packages (Source, Contact, Content, Context, Legal, and Utility) that formerly held tags have been eliminated.
- To further streamline version 3.0, the Product element that was formerly nested inside the Research element has been removed.
- In RIXML v3.0, nearly all of the tags within the ResearchProductType are presented as List elements, most of which are optional. Each of these list elements, when used, holds one or more of the relevant elements; for example, the TitleList element can hold one or more Title elements, providing the ability to tailor the title to multiple audiences, present them in different languages, etc.
- As with prior versions, tag re-use is employed whenever possible to make implementing and maintaining the standards more efficient. To further improve efficiency, we have introduced a few additional attribute groups (see appendix for details).
- V2.5 and earlier had significantly more named Types defined in the Common schema. This has been reduced to 6 named types in the current version, representing the tag sets that are used in multiple places throughout the Standards Suite.
- *eventIndicator* has been renamed to *isEvent*, and we have added *isInternalOnly*, *isResearch*, *isRedacted*, and *isSponsored* flags; use of these is defined below. All of these now use the XML *xs:boolean* data type rather than the RIXML-defined “YesNoEnum” that *eventIndicator* used in prior versions. *YesNoEnum* has been replaced by *xs:Boolean* throughout the standards.
- Finally, to add consistency and flexibility, nearly all of the tags within the ResearchProductType are presented as ...List elements, most of which are optional. Each of these list elements, when used, holds one or more of the relevant elements; for example, the *TitleList* element can hold one or more *Title* elements, providing the ability to tailor the title to multiple audiences, present them in different languages, etc. (These are more fully explained below).

This section outlines the tags used in the RIXML-Research-3_0.xsd file; the remainder of the document covers the tags contained in the RIXML-Common-3_0.xsd schema file that are referred to in the Research Standard.

The RIXML Research schema file (named *RIXML-Research-3_0.xsd*) contains the tags required to describe a research item – a research report, a model, a podcast, etc. This file is very lightweight, relying heavily on the RIXML Common schema file (*RIXML-Common-3_0.xsd*) to hold and define most of the tags used to describe an individual research item. This is done to make these tags available to the other standards in the RIXML Standards Suite as well, allowing publishers to leverage the same tags for multiple purposes in a consistent manner.

In an individual research item, only a few tag sets are required: the PublishingActionList allows publishers to indicate why this RIXML record is being published, the OrganizationList allows publishers to indicate who is publishing it, and the TitleList allows publishers to indicate what the item is called. The ResourceList is almost always used, as it contains the information about the research items that the RIXML tag file is describing – the company report PDF, model Excel file, interactive sector comparison tool on the publisher’s website, etc.; however, because there are rare circumstance when this may not exist – if the entirety of the information can be conveyed in the RIXML tag file, or when the record exists to describe an event – this tag set is optional. Publishers will mix and match the other tag sets as needed to describe the content of the individual research item being described.

The Research Product wrapper

ResearchProduct

ResearchProduct is the root tag for a single research product. It refers to a unique "research idea", as opposed to an actual research publication. It is possible to publish multiple documents or other files (called "resources") with the same productID, provided they all refer to the same discrete research idea. Examples of a product include a research note, research report, conference call webcast, and morning meeting compilation. Examples of multiple resources published with the same productID are (1) a document published in English, with exact translations in German, French, and Japanese, (2) an audio file of a presentation and the transcript of the publication or (3) a single report that consists of a PDF and an Excel file.

Required unique key tags

ResourceKeyID	Required	xs:key
ResourceKeyRef	Optional	xs:keyref (related to ResourceKeyID)
PhotoKeyRef	Optional	xs:keyref (related to ResourceKeyID)

Aggregations

ResearchProduct	Required	type: ResearchProductType
-----------------	----------	---------------------------

Attributes

productID	Required	xs:string
This is to facilitate the unique identification of a particular product. To ensure uniqueness it is recommended that a Universal Unique Identifier (UUID) be used as the productID. UUIDs can be generated on any computer, regardless of platform or operating system. A UUID is a 128-bit (16-byte) integer that is virtually guaranteed to be unique in the world across space and time. The Open Software Foundation (OSF) created UUIDs, as part of their Distributed Computing Environment (DCE).		
createDateTime	Required	xs:dateTime
This marks the date/time at which this RIXML instance document was formed. It is expressed using ISO 8601 as refined by the World Wide Web Consortium's note http://www.w3.org/TR/NOTE-datetime . In addition, RIXML requires the use of Zulu time or Z-time (GMT +/- n hours:minute:seconds). All times are absolute and easier to compute, rather than using a relative (i.e. 08:30 +5) time.		
publicationDateTime	Required	xs:dateTime
Indicates the date and time at which the ResearchProduct was officially published. This is the date and time that would appear on the content itself, such as on the cover page of a written report. It is expressed using ISO 8601 as refined by the World Wide Web Consortium's note http://www.w3.org/TR/NOTE-datetime . In addition, RIXML requires the use of Zulu time or Z-time (GMT +/- n hours:minute:seconds). All times are absolute and easier to compute, rather than using a relative (i.e. 08:30 +5) time.		
principalMedium	Optional	rixmlenum:ProductMediumEnum
Indicates if the ResearchProduct is principally a written research piece, or a video, or an audio, etc.. A ResearchProduct that is a piece of written research with other media embedded as exhibits is still a piece of written research, with a value of Standard here. This is meant to be a higher level indicator than the Category element covers.		
language	Required	rixmlenum:ISO639LanguageType
Indicates the language of the RIXML document -- i.e. the language of the publisher-supplied tag values contained in the RIXML-based XML file for this research item. Described using the ISO 639 Code.		
isPeriodical	Optional	xs:boolean
Indicates if the content is a periodical publication.		
isEvent	Optional	xs:boolean
Indicates if the content represents an Event rather than a traditional ResearchProduct. Defaults to false.		
isInternalOnly	Optional	xs:boolean
Indicates if the content is for internal consumption only. Defaults to false.		
isResearch	Optional	xs:boolean
Used to clearly distinguish research as defined by FINRA 2241 from non-research. Default is true.		
isRedacted	Optional	xs:boolean
A cue from the publisher that this product has been redacted in some way. That is, some content has been obscured or removed relative to the full rendition. Defaults to false.		
isSponsored	Optional	xs:boolean
A cue from the publisher that this product is Sponsored Research. Defaults to false.		

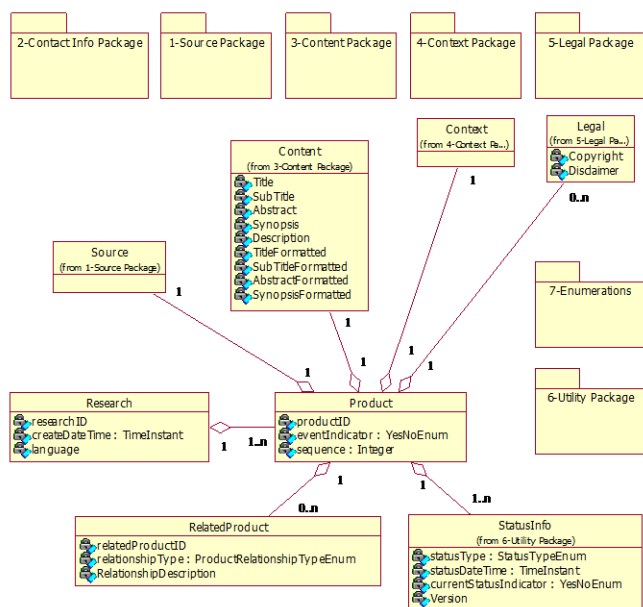

Aggregations

PublishingActionList	Required	(This represents the publisher(s) of the ResearchProduct)

EntitlementList	Optional	
DisclosureList	Optional	

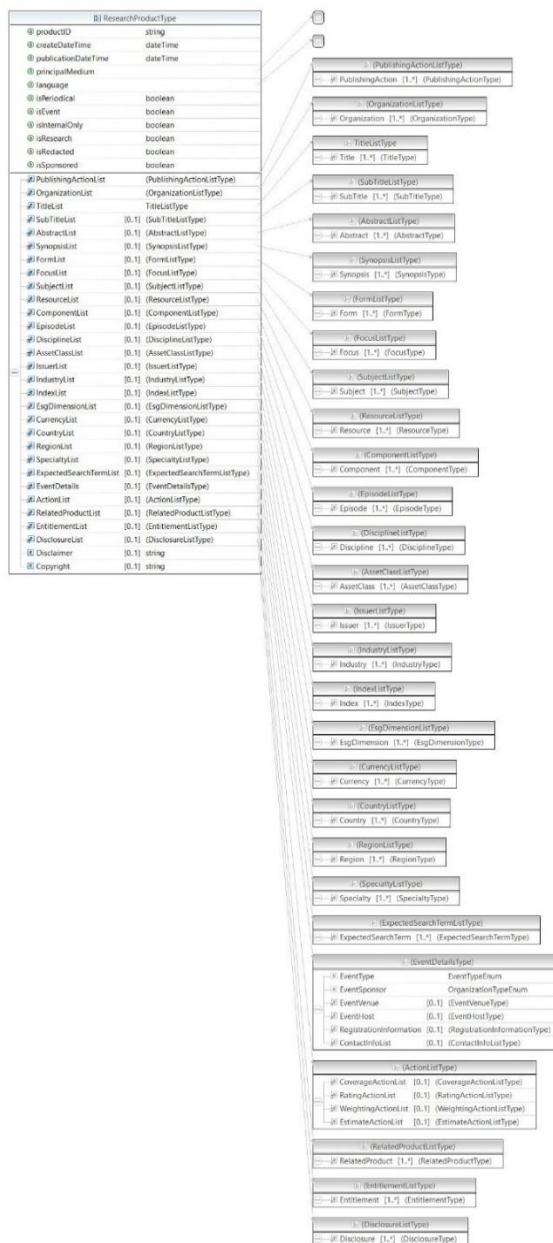

Elements

Disclaimer	Optional	xs:string
Any boilerplate disclaimer text the publisher elects to include with this ResearchProduct. Note that this is meant to be distinct from the disclosure text included in the DisclosureList element.		
Copyright	Optional	xs:string
The copyright line associated with this ResearchProduct.		

OLD DIAGRAM (v2.5)

V3.0 RELEASE CANDIDATE

Publishing content

What's the same / what's different

- Status has been renamed to PublishingAction
- PublishingActionList is now a top level element in the ResearchProduct element; the Legal package has been retired
- multiples are handled via the PublishingActionList
- currentStatusIndicator has been renamed isMostRecent
- an editorialComment attribute has been added to allow publishers to provide clarity regarding the reason for a publishing action change.

Capturing the publication lifecycle

The *PublishingActionList* allows for a timestamped record of changes made to a RIXML Research instance document and to each individual file or other resource contained in it, to a coverage update, or to a roster update. While many items will simply be published, others may need to later be revised, recalled, deleted, have tags updated, or otherwise require adjustments to the initial publication. *PublishingAction* is used as follows:

- In the *ResearchProduct* tag set in the Research standard, it indicates the publishing action being taken for the instance document itself.
- In the *Resource* tag set in the Research standard, it indicates the action for each separate resource (file or URL) contained in the research product.
- In the *CoverageUpdateType* definition in the Coverage Updates standard, we use a subset of the enumeration list values to indicate an addition, revision, or deletion to a coverage pairing.
- In the *RosterUpdateType* definition in the Roster Updates standard, we use a subset of the enumeration list values to indicate an addition, revision, or deletion to a roster update record.

Tags providing information about the publishing action

PublishingActionList

Container element for one or more individual PublishingAction elements. PublishingAction elements are meant to accumulate here across the lifecycle of the research product so that the full history is available in the PublishingActionList.

Aggregations

PublishingAction	Required, multiples allowed
------------------	-----------------------------

PublishingAction

Describes an individual publishing action within the overall publication history of this research product. Each history must begin with the initial publication, which can be followed by other actions, such as one or more revisions or a deletion, etc..

Attributes

publishingActionType	Required	rixmlenum:PublishingActionTypeEnum
Indicates the specific type of publishing action represented here.		

publishingActionDateTime	Required	xs:dateTime
Indicates the date and time at which the publishing action was executed. It is expressed using ISO 8601 as refined by the World Wide Web Consortium's note http://www.w3.org/TR/NOTE-datetime . In addition, RIXML requires the use of Zulu time or Z-time (GMT +/- n hours:minute:seconds). All times are absolute and easier to compute, rather than using a relative (i.e. 08:30 +5) time.		

isMostRecent	Required	xs:boolean
Indicates whether or not this publishing action is the most recent. The value of this attribute can be derived from the dateTime stamps on all actions in the list. While a given research product can have multiple publishing actions, only one of them can be the most recent. This		

attribute is included as a convenience in downstream processing.

version

Optional

xs:string

Support for internal versioning of a given product.

editorialComment

Optional

xs:string

An opportunity for including an editorial comment explaining the reason for this publishing action - mostly for revisions and deletions.

DRAFT

Describing the resources (individual files/URLs) in this research item

Listing the individual files/URLs (resources) in this research item

What's the same / what's different

- Multiples are now handled via the *ResourceList* element, and *Resource* is no longer contained within the (retired) *Content* package.
- Many of the tag names in this element have been updated; however, the tags within this element are quite similar to v2.5.
- The *Price* element has been removed, as member firms indicated that they had other ways of indicating a price, leaving this tag set unneeded and unused.

In the Research standard, we use the term *resource* to describe the research content that is being described by the RIXML instance document (tagging file) - that is, the PDF, Excel, audio or video file(s) and/or URL where the research content is housed. A RIXML instance document usually has a single resource associated with it; however, it is not uncommon for there to be more than one - for example, there may be two PDFs - one a translation of the primary one, or there may be a PDF research report and one or more Excel models. See the main Research Standard section for more information.

ResourceList

Container element for one or more individual *Resource* elements.

Aggregations

Resource	Required, multiples allowed
-----------------	------------------------------------

Resource

Describes the resource that contains the media representation of the research product. For example, can describe a file, URL, or encoded data that represents the product. There can be any number of *Resource* elements associated with a product. For example, a product may consist of both a PDF document (one resource) and an Excel spreadsheet (another resource), or there could be multiple language versions of the same document (each one a resource).

Attributes

resourceID	Required	xs:string
The unique identifier of the resource within the product. The implementation of the resourceID is left for the publishers of content to implement as they deem fit. At a minimum, the resourceID is required to be unique within the product(s) it appears under.		
language	Optional	rixmlenum:ISO639LanguageType
Indicates the language of the resource, described using the ISO 639 Code. Highly recommended, especially when multiple resources are included that are different translations of the same product. Whereas the language attribute of the <i>Research</i> element represents the language of the metadata describing the Research, the language attribute of the <i>Resource</i> element represents the language of the media representation (often a file) of the product. These two language attributes may be different.		
sizeInBytes	Optional	xs:string
Indicates the size of the resource in bytes. Could be used by the end user to estimate the download time and storage needs.		
type	Optional	rixmlenum:ResourceTypeEnum
sequence	Optional	xs:positiveInteger
If there are multiple elements specified, and they should appear in a certain order when the content is published, indicate the desired order by associating an appropriate sequence number to each one.		
isPrimary	Required	xs:boolean
Indicates the primary element when more than one are specified.		

Elements

Protocol	Optional	xs:string
Indicates the protocol (rules determining format and transmission). This eliminates the need for parsing this information from the URL.		
MIMETYPE		xs:string
Indicates the type of media used to store the content. MIMETYPE is used to determine the software product(s) that can read the content. MIMETypes are described in RFC 2046.		
ResourceName	Optional	xs:string
The ResourceName element is intended to provide a research consumer with a suggestion on how to store the particular resource, whether it comes via an actual file, embedded data or remote URL. If this RIXML file arrives with a companion file (PDF, Word, text, etc.) representing this resource, then the ResourceName value is used to match the resource with right companion file. If a payload file is embedded data, the ResourceName value is used by the publisher to suggest a file name to the consumer, who may choose to store the embedded data locally. If a payload file is referenced via URL, the ResourceName value is similarly used by the publisher to suggest a file name to the consumer for local storage.		
Comment	Optional	xs:string
Any additional comments that are deemed necessary. For example, which software version is required to open the document.		
ResourceURL	Optional	xs:anyURI
Indicates the URL at which the resource can be found.		
ResourceData	Optional	xs:base64Binary
Used when the content (data) of the research product needs to be included within the RIXML document. The data must be base64-encoded.		
ResourceXMLData	Optional	

Aggregations

Length	Optional
PublishingActionList	Optional
ContextTagList	Optional
Container for one or more ContextTag elements that apply to the Resource.	

Contained in ResourceList: Length

Length
Indicates the length of a Resource. For example, if the Resource were a PDF file, the length would typically be in pages.

Root element details

[Content added as the value of this element]	Required	xs:string
---	-----------------	------------------

Attributes

lengthUnit	Required	rixmlenum:LengthUnitEnum
Indicates the unit of length. For example pages, seconds, minutes.		

Tags related to legal and access information

What's the same / what's different

- The legal package has been removed; DisclosureList is now used to contain one or more Disclosure elements, the Copyright element is now a top-level element within the Research schema file, and Hedge has been removed.
- The Entitlement element has been significantly streamlined, based on input that the implementation in v2.5 and earlier was overly complex and largely unused. V3.0 has updated the tag set to reflect the current usage in the marketplace.

Disclaimers and Copyright information are described in the main *Research Standard* section. Multiples are allowed for both Disclosures and Entitlements, so those tag sets are defined here:

Disclosure information

DisclosureList

Container element for one or more individual Disclosure elements.

Aggregations

Disclosure	Required, multiples allowed
------------	-----------------------------

Disclosure

Disclosure information from the publisher that accompanies this research product, typically about potential conflicts of interest.

Attributes

code	Optional	xs:string
Indicates a publisher defined disclosure code for a specific disclosure. For example, a publisher may need to disclose a banking relationship with a company, and may call this disclosure code B01.		

Elements

DisclosureText	Required	xs:string
----------------	----------	-----------

Aggregations

IssuerIDList	Optional
For DisclosureText that applies to specific Issuers discussed within this ResearchProduct, these Issuers are listed here by their IssuerID values.	
SecurityIDList	Optional
For DisclosureText that applies to specific Securities discussed within the ResearchProduct, these Securities are listed here by their SecurityID values.	

Entitlement information

EntitlementList

Container element for one or more individual Entitlement elements.

Aggregations

Entitlement	Required, multiples allowed
-------------	-----------------------------

Entitlement

Root element details

[Content added as the value of this element]	Required	xs:string
The name or code that signals specific entitlement intentions between publishers and platforms.		

Attributes

entitlementContext	Optional	xs:string
The context in which this entitlement has meaning, such as a specific third party aggregation platform. Publishers should get these values directly from the platforms that are looking for them in the supplied RIXML instance documents.		

Framing the content

What’s the same / what’s different

- `principalMedium` has been introduced in recognition of the fact that research content is being published in more formats than in the past, and more non-traditional research is being published using the tools and systems formerly used only for traditional research.
- `ProductCategory` has been renamed `Form`, it is enclosed in `FormList` to capture multiples, and the `FormEnum` enumeration list has quite a few new options.

In addition to describing what a research item is about, a RIXML Research record also needs to indicate more broadly what the research item *is*: is it a piece of written research or a video file? A model or a report? What discipline and research approach were used? As shown in section 3 in the high-level overview, there are three components to this: the *principalMedium* attribute, the *Form* element, and the *Discipline* element, which contains both the *DisciplineType* element and the *ResearchApproach* element. To give a sense of how these terms work together to give a picture of what “kind” of research item is being described, here are the enumerations available for these tag sets:

principalMedium	Form	Discipline	
		disciplineType	researchApproach
Written Audio Video Interactive Mixed	Comment Report Model Chart Compilation Presentation Event Primer Directory Glossary Overview EventInvitation PostEventSummary Podcast Interview PanelDiscussion ExhibitExplainer EventRecording Marketing TrainingMaterial PublisherDefined	Investment Strategy Economics	Fundamental Quantitative Technical

The `principalMedium` is an attribute to the top-level tag in the main Research tag set, and the definition appears in that section. It is also available as an attribute for any individual file (Resource) that is included in a Research item.

Details for the other tag sets appear below.

Form information

FormList

Container element for one or more individual Form elements.

Aggregations

Form	Required, multiples allowed
------	-----------------------------

Form

Describes the form taken by the product. Forms include Comment, Report, Model, Chart, etc.. This is meant to provide some finer grained information beyond the ResearchProduct.principalMedium attribute.

Attributes

form	Required	rixmlenum:ProductFormEnum
formPublisherDefinedValue	Optional	xs:string
If the form attribute is set to PublisherDefined, then the publisher can express it according to its own sensibilities.		

Discipline information

DisciplineList

Container element for one or more individual Discipline elements.

Aggregations

Discipline	Required, multiples allowed
------------	-----------------------------

Discipline

Describes the high level content classification of a research product based on its intellectual and analytical approach.

Attributes

disciplineType	Required	rixmlenum:DisciplineTypeEnum
Indicates the high level discipline of the research product.		
researchApproach	Optional	rixmlenum:ResearchApproachEnum
Indicates the analytical technique used to create the content of the research product. Required when disciplineType is Strategy or Investment.		

Title and summary information

What's the same / what's different

- *Title*, *Subtitle*, *Abstract*, and *Synopsis* are now top-level elements in *ResearchProduct*; the *ContentDetails* package has been retired
- Each of these is now housed within a related ...*List* element to facilitate multiples; this change allows us to eliminate the workarounds that were necessary in v2.5 and earlier to accommodate presenting this information in multiple languages and/or with formatting.

The title, subtitle, abstract, and summary tags allow multiples, and thus employ the ...*List* mechanism. Multiple titles, subtitles, etc. may occur in cases where the publisher wants to make the title and other high-level information appear in multiple languages so that it appears in searches conducted in those languages, even if the report is only published in one language. It may also occur if multiple translations are being distributed in one research record (in which case the overall item may have multiple titles, with the appropriate title also appearing as the title of the individual file in the Resource tag set). Additionally, a publisher may choose to provide multiple titles for different audiences – such as including a more generic title that is displayed for users who are not authorized to view the details in the report’s given title.

Title information

TitleList

(uses named TitleListType-see appendix)

Container type for one or more individual Title elements.

Aggregations

Title	Required, multiples allowed
-------	-----------------------------

Title

Root element details

[Content added as the value of this element]	Required	xs:string
--	----------	-----------

Attributes

language	Optional	rixmlenum:ISO639LanguageType
Indicates the human language in which the element value is expressed. Overrides the language attribute on the overall RIXML instance document for this element.		
includesFormatCoding	Optional	xs:boolean
Indicates whether or not the value includes any format coding. Limited markup permitted - HTML code for paragraph, ordered lists and unordered lists with list items, bold, underline, and italics. Default is false.		
audienceType	Optional	rixmlenum:AudienceTypeEnum
Indicates the target audience for this variation.		
audienceTypePublisherDefinedValue	Optional	xs:string
Indicates the target audience for this variation, only when the audienceType attribute is set to PublisherDefined.		

Subtitle information

SubTitleList

Container element for one or more individual SubTitle elements.

Aggregations

SubTitle	Required, multiples allowed	
----------	-----------------------------	--

SubTitle

Root element details

[Content added as the value of this element]	Required	xs:string
--	----------	-----------

Attributes

language	Optional	rixmlenum:ISO639LanguageType
Indicates the human language in which the element value is expressed. Overrides the language attribute on the overall RIXML instance document for this element.		
includesFormatCoding	Optional	xs:boolean
Indicates whether or not the value includes any format coding. Limited markup permitted - HTML code for paragraph, ordered lists and unordered lists with list items, bold, underline, and italics. Default is false.		
audienceType	Optional	rixmlenum:AudienceTypeEnum
Indicates the target audience for this variation.		
audienceTypePublisherDefinedValue	Optional	xs:string
Indicates the target audience for this variation, only when the audienceType attribute is set to PublisherDefined.		

Abstract information

AbstractList

Container element for one or more individual Abstract elements.

Aggregations

Abstract	Required, multiples allowed	
----------	-----------------------------	--

Abstract

A summary of the information contained in the product. Highlights the salient issues in the document or provides a brief description of the event. Suggested maximum length is 3000 characters.

Root element details

[Content added as the value of this element]	Required	xs:string
--	----------	-----------

Attributes

language	Optional	rixmlenum:ISO639LanguageType
Indicates the human language in which the element value is expressed. Overrides the language attribute on the overall RIXML instance document for this element.		
includesFormatCoding	Optional	xs:boolean
Indicates whether or not the value includes any format coding. Limited markup permitted - HTML code for paragraph, ordered lists and unordered lists with list items, bold, underline, and italics. Default is false.		
audienceType	Optional	rixmlenum:AudienceTypeEnum
Indicates the target audience for this variation.		
audienceTypePublisherDefinedValue	Optional	xs:string

Indicates the target audience for this variation, only when the audienceType attribute is set to PublisherDefined.

Synopsis information

SynopsisList

Container element for one or more individual Synopsis elements.

Aggregations

Synopsis	Required, multiples allowed
----------	-----------------------------

Synopsis

A very brief statement of the subject addressed in the product. This is typically only a few lines and would be appropriate for highly abbreviated displays. Suggested maximum length is 300 characters.

Root element details

[Content added as the value of this element]	Required	xs:string
--	----------	-----------

Attributes

language	Optional	rixmlenum:ISO639LanguageType
Indicates the human language in which the element value is expressed. Overrides the language attribute on the overall RIXML instance document for this element.		
includesFormatCoding	Optional	xs:boolean
Indicates whether or not the value includes any format coding. Limited markup permitted - HTML code for paragraph, ordered lists and unordered lists with list items, bold, underline, and italics. Default is false.		
audienceType	Optional	rixmlenum:AudienceTypeEnum
Indicates the target audience for this variation.		
audienceTypePublisherDefinedValue	Optional	xs:string
Indicates the target audience for this variation, only when the audienceType attribute is set to PublisherDefined.		

Person/Authorship information

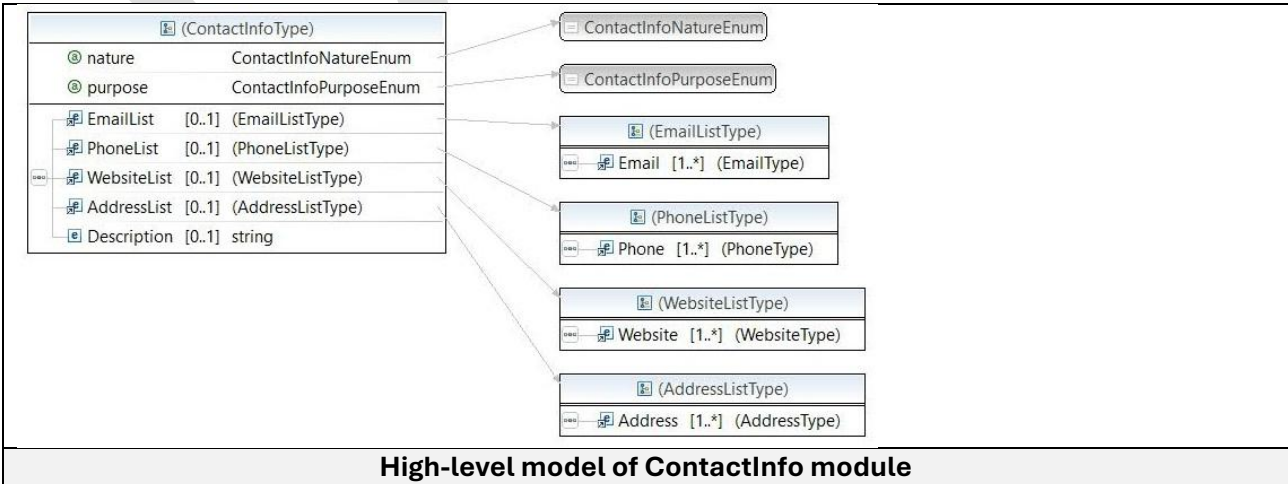

What's the same / what's different

- The ContactInfo package has been retired, replaced by the ContactInfo element, which is extremely similar except as noted.
- Address, Phone, Email, and Website are each now contained within a ...List container element, and multiples are allowed in each.
- As in earlier versions, RIXML Research v3.0 retains the Organization > PersonGroup > Person structure for author information, meaning that even when there is a single author, that author appears within a PersonGroup wrapper.
- Although this framework remains, the Organization, PersonGroup, and Person tag sets have undergone a significant overhaul to provide a more streamlined implementation. Over the years, various tags had to be “bolted on” to these tag sets to accomplish various things (multi-language support, etc.); v3.0 has updated these tag sets to make them cleaner and more intuitive. Tags no longer needed due to this improvement (e.g., PersonDetailsAlternativeLanguages) have been removed.
- The Organization element is largely the same as in v2.5, except that specialty/expertise no longer appears at this level
- The Organization element is now contained within the OrganizationList container element
- InstantMessenger has been removed
- In the Phone section, CountryCode has been removed; country code should now be included as part of the phone number in the contents of the Phone element.
- Expertise has been replaced by Specialties and represents a more streamlined approach
- We have added a PreferredPronouns element.
- BiographyFormatted has been eliminated; the Biography element now has an attribute to indicate that formatting has been used.

Information about individuals and organizations appears throughout the RIXML standards – as the author and publishing firm for a research item, as individuals adding or dropping coverage in a coverage list report, as a participant in an interaction, etc. In the Research standard, we use the following tree structure for authorship: Organization – PersonGroup – Person. That is, a person is *always* part of a PersonGroup, even when they are the only author; this allows a consistent structure regardless of whether a person or a group (or multiples of either or a combination) author a research item.

For efficiency, we have created a *ContactInfo* container that holds phone, address, and email address. This container is used whenever contact information is needed about an individual, a team, or a firm.

In the next few sections, we will first describe the ContactInfo tag set, then the Person tag set, then the PersonGroup tag set, and finally, the Organization tag set, allowing each section to build on the prior one. Note that although this *Organization – PersonGroup – Person* structure represents the structure used for author information in the Research standard, these tags are structured differently in our other standards; see the documentation for each for details.

Contact information

Contact Info wrapper

ContactInfoList

Container element for one or more individual ContactInfo elements.

Aggregations

ContactInfo	Required, multiples allowed
-------------	-----------------------------

ContactInfo

Attributes

nature	Required	rixmlenum:ContactInfoNatureEnum
Used to indicate the nature of the contact information - business or personal.		
purpose	Optional	rixmlenum:ContactInfoPurposeEnum
Describes the intended purpose of the contact information. Gives the reader an idea of what to expect on the far side.		

Aggregations

EmailList	Optional	
PhoneList	Optional	
WebsiteList	Optional	
AddressList	Optional	

Elements

Description	Optional	xs:string
A brief description of the contact information can be included here, if desired. This element is intended to pick up where the purpose attribute leaves off. It offers the ability to provide more detail.		

Part of ContactInfo tag set: address information

AddressList

Container element for one or more individual Address elements.

Aggregations

Address	Required, multiples allowed
---------	-----------------------------

Address

Strongly Recommended. Describes the street address.

Elements

AddressLine1	Required	xs:string
AddressLine2	Optional	xs:string
AddressLine3	Optional	xs:string
AddressLine4	Optional	xs:string
AddressLine5	Optional	xs:string
City	Optional	xs:string
StateProvince	Optional	xs:string
Indicates the State/Province/Canton/County information of the address.		
PostalCode	Optional	xs:string
Indicates the Postal code, quadrant, zone or Zip code.		
Country	Optional	xs:string

This field indicates the country, as it should be displayed.

Part of ContactInfo tag set: Email information

EmailList

Container element for one or more individual Email elements.

Aggregations

Email	Required, multiples allowed
-------	-----------------------------

Email

Strongly Recommended. Indicates the email address.

Root element details

[Content added as the value of this element]	Required	xs:string
--	----------	-----------

Part of ContactInfo tag set: phone information

PhoneList

Container element for one or more individual Phone elements.

Aggregations

Phone	Required, multiples allowed
-------	-----------------------------

Phone

Strongly Recommended. Indicates the complete phone number, including any country code, area code, or other digits required for dialing.

Root element details

[Content added as the value of this element]	Required	xs:string
--	----------	-----------

Attributes

type	Required	rixmlenum:PhoneTypeEnum
------	----------	-------------------------

Phone numbers can be one of the following types - voice, text, voice and text, pager, or fax.

location	Optional	rixmlenum:PhoneLocationEnum
----------	----------	-----------------------------

Describes the location of the phone at this number -- i.e. office, home, mobile.

extension	Optional	xs:string
-----------	----------	-----------

Used in cases where an additional extension number is required to reach a specific person at a given phone number.

Part of ContactInfo tag set: website information

WebsiteList

Container element for one or more individual Website elements.

Aggregations

Website	Required, multiples allowed
---------	-----------------------------

Website

Strongly Recommended. Provides a URI reference for a web site.

Person information

Information about individuals and organizations appears throughout the RIXML standards – as the author and publishing firm for a research item, as individuals adding or dropping coverage in a coverage list report, or as a participant in an interaction.

In the Research standard, individual authors are described using the Person tag set, and all authors appear nested in the PersonGroup tag set – even when there is only one author. As noted in the section above, the ContactInfo tag set is available for use in all three sections, providing maximum flexibility for conveying contact information for an individual, a team or other group, and/or for the organization itself.

The Person wrapper

Note that there is not a PersonList container for multiple instances of a Person tag set because each Person is nested inside a PersonGroup tag set (in the PersonGroupMember tag set). Unlike the other ...List tags that exist in our standards, the PersonGroup tag set has additional functionality. It is not simply a wrapper for a list of Persons; rather, it also conveys information about the group itself. Thus, we have chosen to keep the term PersonGroup to make the distinction between this tag set and its purpose vs. that of the ...List tag sets used throughout the standards. Note that because there can be multiple PersonGroups, the PersonGroupList > PersonGroup structure is used for that tag set.

Person

Describes an individual involved in the product in some capacity.

Elements

PhotoResourceIDRef	Optional	xs:string
An XML Schema keyref that will link to a Resource element representing a small photograph image of the person. Value must match a Resource.resourceID in this ResearchProduct.		

Aggregations

PersonID	Required	PersonIDType (see appendix)
PersonDetailsList	Optional	
ContactInfoList	Optional	
PersonLabelList	Optional	

Part of the Person tag set: the Person Details

PersonDetailsList

Container element for one or more individual PersonDetails elements.

Aggregations

PersonDetails	Required, multiples allowed
---------------	-----------------------------

PersonDetails

Includes name and job information for a person.

Attributes

language	Optional	xmlns:ISO639LanguageType
Indicates the language of the Person Details. If not specified, default to value of language attribute of top ResearchProduct element. If language attribute of ResearchProduct element is not specified, default to English. Described using the ISO 639 Code.		

Elements

DisplayName	Required	xs:string
Indicates how the publisher or person wants the name to be presented, for example: Dr. John Doe Sr. CPA, CFA.		
FamilyName	Required	xs:string
GivenName	Optional	xs:string
MiddleName	Optional	xs:string
FamilyNameSuffix	Optional	xs:string
An accommodation for family name modifiers traditionally appearing after the person's name -- e.g. Jr., Sr., III.		
Credentials	Optional	xs:string
An accommodation for credentials traditionally appearing after the person's name -- e.g. C.F.A., Ph.D., Esq..		
PreferredPronouns	Optional	xs:string
An accommodation for specifying pronouns preferred by the person -- e.g. she/her/hers.		
JobRole	Optional	xs:string
Indicates the functional role played by the person relative to his/her job in the organization, for example, analyst, strategist, economist, etc.		
JobTitle	Optional	xs:string
Indicates the official title of the person within an organization -- e.g. Managing Director, Vice President, etc.		
Division	Optional	xs:string
Indicates the division that the person officially works for within an organization -- e.g. Institutional Equities, Asia Research, etc.		

Aggregations

Biography	Optional
-----------	----------

Part of the PersonDetails tag set: Biography

Biography

Root element details

[Content added as the value of this element]	Required	xs:string
Attributes		

includesFormatCoding	Optional	xs:boolean
Indicates whether or not the value includes any format coding. Limited markup permitted - HTML code for paragraph, ordered lists and unordered lists with list items, bold, underline, and italics. Default is false.		

Part of the Person tag set: the Person label information

PersonLabelList

Container element for one or more individual PersonLabel elements.

Aggregations

PersonLabel	Required, multiples allowed
-------------	-----------------------------

PersonLabel

This element can be used to include a label by which this person is known in the context named in the personLabelContext attribute. Useful for supplying author codes that have meaning on specific vendor platforms.

Root element details

[Content added as the value of this element]	Required	xs:string
--	----------	-----------

Attributes

personLabelContext	Optional	xs:string
This attribute must be used to indicate the specific context for the person label. This would typically be a mnemonic for an individual vendor platform in which the labeled person has a presence. For example, it may be useful for identifying authors of research contributed to a particular vendor platform. Here, a vendor is defined as an organization outside the buy-side and sell-side community of financial services firms which provides platforms or tools used by participants in the investment research economy.		

PersonGroup information

As shown here, in the Research standard, the PersonGroupList contains one or more PersonGroup elements. (Use of the PersonGroup tag set in our other standards will be documented later.) Each PersonGroup element can contain one or more Person elements. Each Person *must* be contained within a PersonGroup element, even if they are the sole author. This structure allows for a variety of authorship options, such as:

- A single author (one Person record nested in one PersonGroup record)
- Two authors working as a team (two Person records nested in a single PersonGroup record, which may or may not also have a name)
- Two authors working independently (two Person records, each contained in a separate PersonGroup record)
- A report published by a team, whose members are listed separately
- A report published by a team, whose members are not named
- A report published by a team, with a co-author not from that team

The Organization > PersonGroup > Person structure was developed to accommodate a wide variety of use cases submitted by member firms. The standards allow a publishing firm to utilize this nesting capability to convey authorship in whatever level of granularity they require, and not all firms will need to leverage all available options. When not needed, firms may choose to essentially omit the PersonGroup level by nesting each individual author inside its own unnamed PersonGroup tag.

While the PersonGroup level is required in the research standard, providing a name for the group is optional; most firms will likely only utilize this option when the group itself is essentially the named author of a research item and the individuals are not listed separately.

While this nesting structure is how authorship information is conveyed in the Research standard, our Coverage Updates and Roster Updates standards use these tag sets somewhat differently; additionally, the Interactions standard uses this nested structure, but uses it to convey information about both the individual who created the interaction record AND about each of the participants in the interaction being described. Documentation for these standards will provide relevant information.

The PersonGroup wrapper

PersonGroupList

Container element for one or more individual PersonGroup elements.

Aggregations

PersonGroup	Required, multiples allowed
-------------	-----------------------------

PersonGroup

The PersonGroup element is used to hold the name(s) of the individual person(s) and/or the name of the group. In the case of an individual person, the person tag and its associated personID are used (no personGroupID or description is needed). PersonGroups can be formally organized groups or they can be fluid groups that come together to deliver content. If the group consists of only one person, there is no need to define a group ID and description. It is sufficient to have the person tag and the associated personID under the group tag.

Attributes

personGroupID	Optional	xs:string
Some unique label used to reference a particular group of people.		
sequence	Optional	xs:positiveInteger
If there are multiple PersonGroups, and they should appear in a certain order when the content is published, indicate the desired order by associating an appropriate sequence number to each one.		
isPrimary	Optional	xs:boolean
Indicates the primary PersonGroup, when more than one are specified. (Note: sequencingAttributeGroup not used here so we can make isPrimary optional.)		
role	Optional	rixmlenum:RoleEnum
The role of the group relative to this research item. This is especially useful if only the group is specified without any members or if all members share the same role -- as in a group of document authors or meeting attendees.		
rolePublisherDefinedValue	Optional	xs:string
If the role attribute has the value PublisherDefined, this attribute is used to hold the publisher's own description of the role.		

Aggregations

PersonGroupNameList	Optional
Indicates the name of the group. This is not required, but can be used where groups are formally named or if there is a name created for the group involved with a publication or event.	
PersonGroupMemberList	Optional
ContactInfoList	Optional

Part of the PersonGroup tag set: naming the PersonGroup

PersonGroupNameList

Container element for one or more individual PersonGroupName elements.

Aggregations

PersonGroupName	Required, multiples allowed
-----------------	-----------------------------

PersonGroupName

This is the full display name of the PersonGroup.

Root element details

[Content added as the value of this element]	Required	xs:string
Attributes		

language	Optional	rixmlenum:ISO639LanguageType
Indicates the human language in which the element value is expressed. Overrides the language attribute on the overall RIXML instance document for this element.		

Part of the PersonGroup tag set: Person Group Member information

PersonGroupMemberList

Container element for one or more individual PersonGroupMember elements.

Aggregations

PersonGroupMember	Required, multiples allowed
-------------------	-----------------------------

PersonGroupMember

Used to define the members of a group, for example, the author(s) of the product. The PersonGroupMember highlights primary persons, and describes the display order of multiple persons.

Attributes

sequence	Optional	xs:positiveInteger
If there are multiple PersonGroupMembers, and they should appear in a certain order when the content is published, indicate the desired order by associating an appropriate sequence number to each one.		
isPrimary	Optional	xs:boolean
Indicates the primary PersonGroupMember, when more than one are specified.		
role	Optional	rixmlenum:RoleEnum
The role of this individual person relative to this research item.		
rolePublisherDefinedValue	Optional	xs:string
If the role attribute has the value PublisherDefined, this attribute is used to hold the publisher's own description of the role.		

Aggregations

Person	Required
--------	----------

Organization information

In the Research standard, the *Organization* tag set is used to identify the publisher(s) of the research item. However, since this tag set is used in various ways throughout the standards, the term *Organization* is used because it is more accurate than the term *Publisher* would be in other places.

The Organization wrapper

OrganizationList

Container element for one or more individual Organization elements.

Aggregations

Organization	Required, multiples allowed
--------------	-----------------------------

Organization

Describes an organization related to the research item. Multiple organizations may be related to one research item. These organizations can be subsidiaries of the same parent or different organizations (as in a joint venture) working together on a publication or event. However, there can only be one primary publisher organization, which is captured by the isPrimary attribute.

Attributes

type	Required	xmlns:OrganizationTypeEnum
typePublisherDefinedValue	Optional	xs:string
For the cases in which the type attribute has the value PublisherDefined, the typePublisherDefinedValue attribute is used to hold the organization's own description of the type.		
sequence	Optional	xs:positiveInteger
If there are multiple elements specified, and they should appear in a certain order when the content is published, indicate the desired order by associating an appropriate sequence number to each one.		
isPrimary	Required	xs:boolean
Indicates the primary element when more than one are specified.		

Aggregations

OrganizationIDList	Optional
OrganizationNameList	Required, multiples allowed
PersonGroupList	Optional
ContactInfoList	Optional

Elements

Description	Optional	xs:string
Optional description of the organization. Used to include any additional information about the organization.		
LogoURL	Optional	xs:anyURI
Indicates a web URL location of a logo graphic for the organization.		

Part of the Organization tag set: Organization identifiers

OrganizationIDList

Container element for one or more individual OrganizationID elements..

Aggregations

OrganizationID	Required, multiples allowed
----------------	-----------------------------

OrganizationID

An identifier used to identify the organization -- multiple are possible. For example, for a product distributed via multiple vendors, each vendor may require a different OrganizationID, with the idType for each OrganizationID identifying the name of the vendor in the manner specified by the vendor. The actual ID is stored as free text in the content of the OrganizationID node. A UUID can also be used as one of the IDs. This is to facilitate the unique identification of a particular organization. To ensure uniqueness it is recommended that a Universal Unique Identifier (UUID) be used as the productID. UUIDs can be generated on any computer, regardless of platform or operating system. A UUID is a 128-bit (16-byte) integer that is virtually guaranteed to be unique in the world across space and time. The Open Software Foundation (OSF) created UUIDs, as part of their Distributed Computing Environment (DCE).

Root element details

[Content added as the value of this element]	Required	xs:string
--	----------	-----------

Attributes

idType	Required	xs:string
Indicates the type of ID used. Examples: CUSIP, VendorCode.		

Part of the Organization tag set: Organization name information

OrganizationNameList

Container element for one or more individual OrganizationName elements.

Aggregations

OrganizationName	Required, multiples allowed
------------------	-----------------------------

OrganizationName

The name of the organization. An organization can have multiple names as enumerated in the Name Types. At least one name is required for the content to be valid. Display name is the preferred name if only one name is provided.

Root element details

[Content added as the value of this element]	Required	xs:string
--	----------	-----------

Attributes

nameType	Required	
rixmlenum:OrganizationNameTypeEnum		
The name can be one of the following types - legal, local, display, or parent. Use Display if using only one nameType, unless one of the other nameTypes is preferred.		
language	Optional	rixmlenum:ISO639LanguageType
Indicates the language of the name value given. Overrides the language attribute on the Research element.		

Defining the focus of a report

In the Research standard, a publisher will use some or all of the available thematic tags (described in the next chapter) to describe what the report is *about* - that is, what companies, industries, regions, etc. are being discussed. To identify what the report is *mostly* about, a publisher will use the Focus tag set and isPrimary attributes that are available for each thematic tag set.

But how does a publisher indicate the main focus of the report? The RIXML Research Standard accomplishes this through the following:

First, the *FocusList* tag set is used to indicate what the report’s primary focus is: is it a company report or an industry overview? Is it primarily discussing a currency, or is it a thematic report based on a particular subject? The publisher would select the focus of the research item – which, with a few exceptions, is the same as the list of content-related tagging options in the list in the *Thematic Tags* chapter introduction, below. If the publisher indicates that the focus is a security, then they must include at least one security identifier in the Focus tag set. In this example, the security identifier listed in the Focus tag set is meant to be a duplicate of one of the security identifiers used in the research item’s *SecurityList* tag set; the Focus tag set only contains the identifier, the related Security tag set contains more information (the company name, for example).

Second, the *isPrimary* flag is used to further clarify: if more than one *Focus* is included, then the publisher will use the *isPrimary* flag on one of them to indicate that it is the primary focus of the research item.

For example, to indicate that Company X is the focus of a report that also mentions other securities, two sectors, and a country, the publisher would set the *isPrimary* flag to “Yes” in the SecurityID tag set for that company within the Focus element.

Tags identifying the focus of the research item

FocusList

Container element for one or more individual ProductFocus elements. This is meant to capture what this ResearchProduct is primarily about, so a selective tagging approach is better than a comprehensive tagging approach. Be judicious in populating the Focus. Avoid multiples where possible.

Aggregations

Focus	Required, multiples allowed
-------	-----------------------------

Focus

Indicates a primary focus of the ResearchProduct. The value of the focus attribute must mate with the specific ID sub-element. That is, if the focus attribute is set to Industry, then include an IndustryID sub-element to specify which Industry.

Attributes

focus	Required	rixmlenum:FocusEnum
Indicates the focus itself. This is the unique focus identifier.		
sequence	Optional	xs:positiveInteger
If there are multiple elements specified, and they should appear in a certain order when the content is published, indicate the desired order by associating an appropriate sequence number to each one.		
isPrimary	Required	xs:boolean
Indicates the primary element when more than one are specified.		

Aggregations (note: choice block, not sequence block)

IndustryID	Optional
Discipline	Optional
IssuerID	Optional
SecurityID	Optional
RegionID	Optional
CountryID	Optional
AssetClassID	Optional
EsgDimensionID	Optional
IndexID	Optional
CurrencyID	Optional
MarketID	Optional
Subject	Optional
Specialty	Optional

Thematic tags

What’s the same / what’s different

- Most of the tags related to describing the content in a research item were in the Source package in v2.5.
- ProductFocus has been renamed Focus, and is contained in the FocusList element to allow for multiples. It now also includes the ability to add an identifier to more clearly indicate the exact entity that is the focus (that is, if the focus is a security, you can add the security ID of the security that is the focus; or the industry ID can be added as the focus of a report tagged as having a focus of industry). The intent is that the identifier indicated in the Focus element also exists in the relevant ...List element, where more information about that entity is conveyed. (For example, if Focus = Security, then a SecurityID would be included in the Focus element; that SecurityID would also exist in that record’s SecurityList, where the security’s name and other relevant information would be conveyed.
- Asset class, asset type, and security type were separate tags in v2.5 and earlier, even though they were intended to act in a tree structure. We have merged these into AssetClass/AssetClassList
- SectorIndustry has been renamed Industry but continues to describe the full sector/industry tree structure
- See the list below for the ...List tags that now appear as top-level tags in the Research standard; several of these did allow for multiples in prior versions, but we now use “List” at the end of the element name for clarity (vs. Specialties > Specialty convention used before)
- We recommend reviewing each tag set in this section, as they have undergone a number of changes.

The tag sets in this section are the ones that answer the question, *What is this research item about?* The top level of the Research Standard provides the following tag sets aimed at describing the content in the research item:

AssetClassList	IssuerList
CountryList	MarketList
CurrencyList	RegionList
DisciplineList	SecurityList
ESG DimensionList	SpecialtyList
IndexList	SubjectList
IndustryList	

Indicating what a particular research report or other research item is about may involve using one or more of these tag sets; additionally, a report may include one or more items within each category. For example,

- A single company report could list one *Security*; it might also list additional securities that are mentioned in the report, even if they aren’t the primary focus
- An industry overview could list individual companies in addition to listing the industry that is the main focus of the report; it could also indicate a country or region to indicate that the report focuses that industry’s impact within one country or region.

To provide maximum flexibility and because the tag sets required to describe content will vary depending on the nature of an individual research item, these tags are all optional. The intent is that the publisher will select the tag set(s) needed to describe the content of the research item sufficiently to facilitate an end user finding it based on the tagging provided.

However, in addition to the required tags, firms may also include additional tags to provide more guidance about the content in the report: for example, an industry overview may also indicate that it is covering information regarding that industry’s developments in a particular country or region, or may list a few companies that are mentioned with enough depth that a person searching for information about that company might find it useful.

By “mixing and matching” these tag sets, publishers can provide a rich description of the content covered in a research item. Aggregators use these tags to pull like information together; in turn, end users use aggregators’ search tools to find research that meets their needs.

Note that the tag sets below represent the tags that are available at the top level of a research record (the same level in which the *FocusList* appears; the relevant ...ID tag is also used in the *FocusList* tag set, as described above.

Publishers will select which of these tag sets to use based on the content covered in the individual research item.

Tags related to asset class

Asset Class wrapper – with just asset class identifier information

AssetClassID

Element just for identifying an AssetClass, without any additional information.

Attributes

assetClass	Required	rixmlenum:AssetClassEnum
Indicates the asset class itself. This is the unique asset class identifier.		
assetClassPublisherDefinedValue	Optional	xs:string
Used when the assetClass attribute is set to PublisherDefined to indicate an asset class not in the pick list.		
level	Optional	xs:positiveInteger
Indicates the level of this AssetClass within the corresponding AssetClass hierarchy. Top of the hierarchy is level 1, next level down is level 2, etc.. Level is optional here, and only for convenience, because it is officially determined by the hierarchy definition.		
tagSource	Optional	xs:string
In the case of an automated tag, this tagSource attribute would hold a free-form text value indicating the publisher's name for the tagging method applied when not explicit (selected by an author or editor).		
tagConfidence	Optional	xs:decimal
In the case of an automated tag, this tagConfidence attribute would hold a number between zero and one, with one representing perfect high confidence.		

AssetClassIDList

Container type for one or more individual AssetClassID elements.

(uses named AssetClassIDListType)

Aggregations

AssetClassID

Asset class wrapper – with full information

AssetClassList

Container type for one or more individual AssetClass elements.

Aggregations

AssetClass	Required, multiples allowed
------------	-----------------------------

AssetClass

Indicates that the ResearchProduct, or other sub-context, is about a particular asset class.

Attributes

weightingAction	Optional	rixmlenum:WeightingActionEnum
Highlights an action taken by the publisher. Indicates that the publisher is changing the weighting of the security type.		

Elements

AssetClassID	Required	
The identifier information for tagging this AssetClass to this ResearchProduct, or other sub-context.		
DisplayName	Optional	xs:string
The full display name of the AssetClass can be added here for human readability and convenience, but the AssetClassID.assetClass attribute is the actual identifier.		
ParentList	Optional	AssetClassIDListType
Publishers can optionally choose to list out the parent nodes in the AssetClass hierarchy here for convenience. This is not the same as tagging a parent node to this ResearchProduct.		
ChildList	Optional	AssetClassIDListType
Publishers can optionally choose to list out the child nodes in the AssetClass hierarchy here for convenience. This is not the same as tagging a child node to this ResearchProduct.		

Aggregations

RatingList	Optional
WeightingList	Optional

Tags related to country

Country wrapper – with just country identifiers

Used in the Focus tag set or anywhere else the country identifier, without additional information, is used.

CountryIDList

Container element for one or more individual CountryID elements.

Aggregations

CountryID	Required, multiples allowed
-----------	-----------------------------

CountryID

Element just for identifying a Country, without any additional information.

Attributes

code	Required	rixmlenum:ISO3166CountryType
The ISO 3166 code for the country.		

Country wrapper – with full details

CountryList

Container element for one or more individual Country elements.

Aggregations

Country	Required, multiples allowed
---------	-----------------------------

Country

Strongly recommended. Indicates the country or countries that are discussed in a research product.

Attributes

code The ISO 3166-1 code for the country.	Required	rixmlenum:ISO3166CountryType
isEmerging Indicates whether the publisher defines this country as an emerging market. Default is false.	Optional	xs:boolean
sequence If there are multiple elements specified, and they should appear in a certain order when the content is published, indicate the desired order by associating an appropriate sequence number to each one.	Optional	xs:positiveInteger
isPrimary Indicates the primary element when more than one are specified.	Required	xs:boolean
coverageAction Highlights an action taken by the publisher. Indicates that the publisher is changing the coverage status of a Security. Example: a publisher initiates coverage of Security ABC.	Optional	rixmlenum:CoverageActionEnum
ratingAction Highlights an action taken by the publisher. Indicates that the publisher is changing their rating on a Security. Example: a publisher downgrades Security ABC.	Optional	rixmlenum:RatingActionEnum
weightingAction Highlights an action taken by the publisher. Indicates that the publisher is changing the weighting of the security type.	Optional	rixmlenum:WeightingActionEnum
tagSource In the case of an automated tag, this tagSource attribute would hold a free-form text value indicating the publisher's name for the tagging method applied when not explicit (selected by an author or editor).	Optional	xs:string
tagConfidence In the case of an automated tag, this tagConfidence attribute would hold a number between zero and one, with one representing perfect high confidence.	Optional	xs:decimal

Aggregations

RatingList	Optional
WeightingList	Optional

Tags related to currency

Currency wrapper – with just currency identifiers

Used in the Focus tag set or anywhere else the currency identifier, without additional information, is used.

CurrencyIDList

Container element for one or more individual CurrencyID elements.

Aggregations

CurrencyID	Required, multiples allowed
------------	-----------------------------

CurrencyID

Element just for identifying a Currency, without any additional information.

Attributes

currency	Required	rixmlenum:ISO4217CurrencyType
Represented by the three letter alpha code defined by ISO 4217.		

Currency wrapper – with full details

CurrencyList

Container element for one or more individual Currency elements.

Aggregations

Currency	Required, multiples allowed
----------	-----------------------------

Currency

Some research products discuss financial values without mapping to any issuers or securities. Having currency as a possible product classification enables more accurate tagging in those cases. This element requires that a specific currency is indicated. For products discussing currencies in general, publishers should tag the asset class as currencies.

Root element details

[Content added as the value of this element]	Optional	xs:string
The element value can optionally be used to supply the currency name associated with the standard code for human readability and convenience.		

Attributes

currency	Required	rixmlenum:ISO4217CurrencyType
Represented by the three letter alpha code defined by ISO 4217.		

sequence	Optional	xs:positiveInteger
If there are multiple elements specified, and they should appear in a certain order when the content is published, indicate the desired order by associating an appropriate sequence number to each one.		

isPrimary	Required	xs:boolean
Indicates the primary element when more than one are specified.		

tagSource	Optional	xs:string
In the case of an automated tag, this tagSource attribute would hold a free-form text value indicating the publisher's name for the tagging method applied when not explicit (selected by an author or editor).		

tagConfidence	Optional	xs:decimal
In the case of an automated tag, this tagConfidence attribute would hold a number between zero and one, with one representing perfect high confidence.		

Tags related to ESG

ESG wrapper – with just ESG identifiers

Used in the Focus tag set or anywhere else the ESG identifier, without additional information, is used.

EsgDimensionIDList (uses EsgDimensionIDListType)
Container type for one or more individual EsgDimensionID elements.

Aggregations

EsgDimensionID	Required, multiples allowed
-----------------------	------------------------------------

EsgDimensionID
Element just for identifying an EsgDimension, without any additional information.

Attributes

esgDimension	Required	xmlns:esgDimensionEnum
Indicates the ESG dimension itself. This is the unique ESG dimension identifier.		
esgDimensionPublisherDefinedValue	Optional	xs:string
Used when the esgDimension attribute is set to PublisherDefined to indicate an ESG dimension not in the pick list.		
level	Optional	xs:positiveInteger
Indicates the level of this EsgDimension within the corresponding ESG hierarchy. Top of the hierarchy is level 1, next level down is level 2, etc.. Level is optional here, and for convenience only, because it is officially determined by the hierarchy definition.		
tagSource	Optional	xs:string
In the case of an automated tag, this tagSource attribute would hold a free-form text value indicating the publisher's name for the tagging method applied when not explicit (selected by an author or editor).		
tagConfidence	Optional	xs:decimal
In the case of an automated tag, this tagConfidence attribute would hold a number between zero and one, with one representing perfect high confidence.		

ESG wrapper – with full details

EsgDimensionList

Aggregations

EsgDimension	Required, multiples allowed
--------------	-----------------------------

EsgDimension

Indicates that the ResearchProduct, or other sub-context, is about a particular ESG theme. ESG means Enironment, Social, Governance.

Attributes

weightingAction	Optional	rixmlenum:WeightingActionEnum
Highlights an action taken by the publisher. Indicates that the publisher is changing the weighting of the security type.		

Elements

EsgDimensionID	Required	EsgDimensionIDType
The identifier information for tagging this EsgDimension to this ResearchProduct, or other sub-context.		
DisplayName	Optional	xs:string
The full display name of the EsgDimension can be added here for human readability and convenience, but the EsgDimensionID.esgDimension attribute is the actual identifier.		
ParentList	Optional	EsgDimensionIDListType
Publishers can optionally choose to list out the parent nodes in the EsgDimension hierarchy here for convenience. This is not the same as tagging a parent node to this ResearchProduct.		
ChildList	Optional	EsgDimensionIDListType
Publishers can optionally choose to list out the child nodes in the EsgDimension hierarchy here for convenience. This is not the same as tagging a child node to this ResearchProduct.		

Aggregations

WeightingList	Optional
RatingList	Optional

Tags related to index information

Used in the Focus tag set or anywhere else the index identifier, without additional information, is used.

Index wrapper – with just index identifiers

IndexIDList

Container element for one or more individual IndexID elements.

Aggregations

IndexID	Required, multiples allowed
---------	-----------------------------

IndexID

Identifies an index mentioned in the product via an ID symbol of type specified in the idType attribute.

Attributes

idType	Required	rixmlenum:IssuerSecurityIDTypeEnum
Indicates the protocol used for the index identifier (i.e. the classification scheme). Examples include CUSIP, RIC, BloombergCode, etc.		
idTypePublisherDefinedValue	Optional	xs:string
If the IndexID.idType = PublisherDefined, then the publisher can indicate a type of index identifier not in the IssuerSecurityIDTypeEnum list.		
idValue	Required	xs:string
The actual symbol identifying the index.		

Index wrapper – with full details

IndexList

Container element for one or more individual Index elements.

Aggregations

Index	Required, multiples allowed
-------	-----------------------------

Index

Indicates an index mentioned in the product.

Attributes

type	Optional	rixmlenum:IndexTypeEnum
An indication of the type of index. Typically market, industry or country.		
displayName	Optional	xs:string
A descriptive name of the index suitable for display purposes.		

Aggregations

IndexID	Optional, multiples allowed
Country	Optional
Region	Optional
Industry	Optional
Weighting	Optional, multiples allowed
Rating	Optional, multiples allowed

Tags related to industry (and sector) information

Industry wrapper – with just industry identifiers

IndustryIDList (uses IndustryIDListType)

Container type for one or more individual IndustryID elements.

Aggregations

IndustryID	Required, multiples allowed
------------	-----------------------------

IndustryID

Element just for identifying an Industry, without any additional information.

Attributes

industry	Required	xs:string
Indicates the industry itself. This is the unique industry identifier within the referenced industry taxonomy. Note that these identifiers are not bound to an enumerated picklist in this schema. They come from the referenced taxonomy, which is defined externally.		
industryTaxonomy	Required	rixmlenum:IndustryTaxonomyEnum
Name of the taxonomy, hierarchy, or classification method used, in which the specified industry identifier has meaning. Note that a value of PublisherDefined just means the taxonomy was created by the publisher and does not imply a separate PublisherDefinedValue anywhere.		
level	Optional	xs:positiveInteger
Indicates the level of this Industry within the corresponding Industry hierarchy. Top of the hierarchy is level 1, next level down is level 2, etc.. Level is optional here because it is usually determined by the specific industry taxonomy.		
tagSource	Optional	xs:string
In the case of an automated tag, this tagSource attribute would hold a free-form text value indicating the publisher's name for the tagging method applied when not explicit (selected by an author or editor).		
tagConfidence	Optional	xs:decimal
In the case of an automated tag, this tagConfidence attribute would hold a number between zero and one, with one representing perfect high confidence.		

Elements

DisplayName	Optional	xs:string
The full display name of the Industry can be added here for human readability and convenience, but the industry attribute is the actual identifier.		

Industry wrapper – with full details

IndustryList

Container type for one or more individual Industry elements.

Aggregations

Industry	Required, multiples allowed
----------	-----------------------------

Industry

Indicates that the ResearchProduct, or other sub-context, is about a particular industry.

Attributes

officiallyClassified	Optional	xs:boolean
For cases in which this Industry is associated with an Issuer or Security, the officiallyClassified attribute indicates whether or not that association is official within the cited taxonomy or represents a estimated or best-fit or best-guess association.		
sequence	Optional	xs:positiveInteger
If there are multiple elements specified, and they should appear in a certain order when the content is published, indicate the desired order by associating an appropriate sequence number to each one.		
isPrimary	Required	xs:boolean
Indicates the primary element when more than one are specified.		
coverageAction	Optional	rixmlenum:CoverageActionEnum
Highlights an action taken by the publisher. Indicates that the publisher is changing the coverage status of a Security. Example: a publisher initiates coverage of Security ABC.		
ratingAction	Optional	rixmlenum:RatingActionEnum
Highlights an action taken by the publisher. Indicates that the publisher is changing their rating on a Security. Example: a publisher downgrades Security ABC.		
weightingAction	Optional	rixmlenum:WeightingActionEnum
Highlights an action taken by the publisher. Indicates that the publisher is changing the weighting of the security type.		

Elements

IndustryID	Required	IndustryIDType
------------	----------	----------------

Aggregations

ParentList	Optional	IndustryIDListType
Publishers can optionally choose to list out the parent nodes in the Industry hierarchy here for convenience. This is not the same as tagging a parent node to this ResearchProduct.		
ChildList	Optional	IndustryIDListType
Publishers can optionally choose to list out the child nodes in the Industry hierarchy here for convenience. This is not the same as tagging a child node to this ResearchProduct.		
RatingList	Optional	
WeightingList	Optional	

Tags related to issuer (corporate, governmental, or other)

In the RIXML Standards Suite, *Issuer* refers to any entity that issues any type of security; *Security* refers to a particular security. *Security* tagging lives within the *Issuer* module, although the *Security* tag set is optional and does not apply to all situations. Some issuers issue both equity and fixed income securities; others issue just one; additionally, an individual research item may discuss a particular security or it may discuss the issuer itself. For example, an equity single company report would likely be most accurately tagged at the security level, whereas a report published by a municipal bond analyst would likely be most accurately tagged at the issuer level, with the analysis applying to most or all of that issuer's bonds.

NOTE: We will be providing additional guidance regarding the intended use of Issuer tags and Security tags to ensure consistent application. We will be discussing the details so that as a group we can determine how to standardize usage as much as possible and to ensure that we have considered a wide range of use cases.

Issuer wrapper – with just Issuer ID

IssuerIDList

Container element for one or more individual IssuerID elements.

Aggregations

IssuerID	Required, multiples allowed
----------	-----------------------------

IssuerID

Used to uniquely identify the issuer.

Root element details

[Content added as the value of this element]	Required	xs:string
--	----------	-----------

Attributes

idType	Required	rixmlenum:IssuerSecurityIDTypeEnum
Indicates the organization or company's protocol used for the issuer identifier (i.e. the Issuer classification scheme). Note that since there is no universally accepted means of identifying an Issuer (as opposed to a specific security), IssuerID allows the use of what are technically security identifiers as a means of identifying an Issuer (CUSIP, SEDOL, etc).		
idTypePublisherDefinedValue	Optional	xs:string
If the IssuerID.idType = PublisherDefined, then the publisher can indicate what type of identifier has been used.		

Issuer wrapper – with full details

IssuerList

Container element for one or more individual Issuer elements.

Aggregations

Issuer	Required, multiples allowed
--------	-----------------------------

Issuer

Attributes

issuerType	Required	rixmlenum:IssuerTypeEnum
Indicates the type of Issuer. For example, can be agency, government or corporate.		
domicileCountryCode	Optional	rixmlenum:ISO3166CountryType
Indicates the country where the Issuer is domiciled, represented by the ISO 3166-1 country code.		
fiscalYearEnd	Optional	xs:gMonthDay
Combination of Day and Month that indicates the fiscal year end of the Issuer.		
sequence	Optional	xs:positiveInteger
If there are multiple elements specified, and they should appear in a certain order when the content is published, indicate the desired order by associating an appropriate sequence number to each one.		
isPrimary	Required	xs:boolean
Indicates the primary element when more than one are specified.		
coverageAction	Optional	rixmlenum:CoverageActionEnum
Highlights an action taken by the publisher. Indicates that the publisher is changing the coverage status of a Security. Example: a publisher initiates coverage of Security ABC.		
ratingAction	Optional	rixmlenum:RatingActionEnum
Highlights an action taken by the publisher. Indicates that the publisher is changing their rating on a Security. Example: a publisher downgrades Security ABC.		
weightingAction	Optional	rixmlenum:WeightingActionEnum
Highlights an action taken by the publisher. Indicates that the publisher is changing the weighting of the security type.		
tagSource	Optional	xs:string
In the case of an automated tag, this tagSource attribute would hold a free-form text value indicating the publisher's name for the tagging method applied when not explicit (selected by an author or editor).		
tagConfidence	Optional	xs:decimal
In the case of an automated tag, this tagConfidence attribute would hold a number between zero and one, with one representing perfect high confidence.		

Elements

LogoURL	Optional	xs:anyURI
Indicates a web URL location of a logo graphic for the Issuer.		
Description	Optional	xs:string
A text description (name) of the Issuer. Strongly Recommended element.		

Aggregations

IssuerNameList	Required
IssuerIDList	Optional
FinancialDates	Optional
IssuerFinancialsList	Optional
RatingList	Optional
WeightingList	Optional
ResourceLink	Optional, multiples allowed
IndustryList	Optional

This is the list of industries of which the Issuer is a participant. This is not necessarily the list of industries discussed in this ResearchProduct.

SecurityList	Optional
---------------------	-----------------

This is the list of securities issued by this Issuer that are also discussed in this ResearchProduct.

Subset of issuer: issuer name

IssuerNameList

Container element for one or more individual IssuerName elements.

Aggregations

IssuerName	Required, multiples allowed
-------------------	------------------------------------

IssuerName

This is the name of the enclosing Issuer.

Root element details

[Content added as the value of this element]	Required	xs:string
---	-----------------	------------------

Attributes

issuerNameType	Required	rixmlenum:OrganizationNameTypeEnum
An issuer can have multiple names. Each name can be one of the following types: legal, local, display, parent, trading. Use Display if using only one issuerNameType, unless one of the other issuerNameTypes is preferred.		

Subset of issuer: issuer financials

IssuerFinancialsList

Container element for one or more individual IssuerFinancials elements.

Aggregations

IssuerFinancials	Required, multiples allowed
-------------------------	------------------------------------

IssuerFinancials

Financial data related to the issuer of a security.

Root element details

[Content added as the value of this element]	Required	FinancialsType (see appendix)
---	-----------------	--------------------------------------

Attributes

issuerFinancialsType	Required	rixmlenum:IssuerFinancialsTypeEnum
-----------------------------	-----------------	---

Subset of issuer: identifying the protocol used for financials

ResourceLink

Attributes

type	Required	rixmlenum:ResourceTypeEnum
idRef	Required	xs:string

Subset of issuer: the Security wrapper – with just security identifiers

SecurityIDList

Container element for one or more individual SecurityID elements.

Aggregations

SecurityID	Required, multiples allowed
------------	-----------------------------

SecurityID

Used to uniquely identify the security

Attributes

idType	Required	rixmlenum:IssuerSecurityIDTypeEnum
Indicates the organization or company's protocol used for the security identifier (i.e. the Security classification scheme). Examples include CUSIP, RIC, BloombergCode, etc.		
idTypePublisherDefinedValue	Optional	xs:string
If the SecurityID.idType = PublisherDefined, then the publisher can indicate a type of security identifier not in the IssuerSecurityIDTypeEnum list.		
idValue	Required	xs:string
The actual unique identifier for this security. Example: MSFT.O is correct idValue for Microsoft Common Shares using the Reuters RIC scheme.		
marketCountryCode	Optional	rixmlenum:ISO3166CountryType
The ISO 3166-1 Country code for the country in which the trading exchange or market operates.		

Aggregations

MarketID	Optional
----------	----------

Subset of issuer: the Security wrapper – with full details

SecurityList

Container element for one or more individual Security elements.

Aggregations

Security	Required, multiples allowed
----------	-----------------------------

Security

Information about a particular security that describes the type of security and how to identify it. A security is always issued by an issuer, therefore, if a security is being mentioned, it must be attached to an Issuer element.

Attributes

targetPriceAction	Optional	rixmlenum:TargetPriceEnum
Highlights an action taken by the publisher. Indicates that the publisher is changing their target price estimate for a Security. Example: a publisher increases a target price for Security ABC to \$100.		
estimateAction	Optional	rixmlenum:EstimateActionEnum
Highlights an action taken by the publisher. Indicates that the publisher is changing their earnings estimates for a Security. Example: a publisher lowers all their earnings estimates for Security ABC.		
sequence	Optional	xs:positiveInteger
If there are multiple elements specified, and they should appear in a certain order when the content is published, indicate the desired order by associating an appropriate sequence number to each one.		
isPrimary	Required	xs:boolean
Indicates the primary element when more than one are specified.		
coverageAction	Optional	rixmlenum:CoverageActionEnum
Highlights an action taken by the publisher. Indicates that the publisher is changing the coverage status of a Security. Example: a publisher initiates coverage of Security ABC.		
ratingAction	Optional	rixmlenum:RatingActionEnum
Highlights an action taken by the publisher. Indicates that the publisher is changing their rating on a Security. Example: a publisher downgrades Security ABC.		
weightingAction	Optional	rixmlenum:WeightingActionEnum
Highlights an action taken by the publisher. Indicates that the publisher is changing the weighting of the security type.		
tagSource	Optional	xs:string
In the case of an automated tag, this tagSource attribute would hold a free-form text value indicating the publisher's name for the tagging method applied when not explicit (selected by an author or editor).		
tagConfidence	Optional	xs:decimal
In the case of an automated tag, this tagConfidence attribute would hold a number between zero and one, with one representing perfect high confidence.		

Elements

SecurityName	Optional	xs:string
SecurityShortName	Optional	xs:string
Optional short name commonly used to identify the Security.		

Aggregations

SecurityIDList	Required
FinancialDates	Optional
SecurityFinancialsList	Optional
RatingList	Optional
WeightingList	Optional
IndustryList	Optional

This is the list of industries of which the Security is a participant. This is not necessarily the list of industries discussed in this ResearchProduct.

AssetClassList	Required
----------------	----------

This is the list of asset classes of which the Security is a participant. This is not necessarily the list of asset classes discussed in this ResearchProduct.

Subset of security: security financials

SecurityFinancialsList

Container element for one or more individual SecurityFinancials elements.

Aggregations

SecurityFinancials	Required, multiples allowed
--------------------	-----------------------------

SecurityFinancials

Describes the financials associated with a security.

Root element details

[Content added as the value of this element]	Required	FinancialsType
Attributes		
securityFinancialsType	Required	rixmlenum:SecurityFinancialsTypeEnum
dilution	Optional	rixmlenum:SecurityDilutionEnum

Tags related to market

Market wrapper – with just market identifiers

Used in the Focus tag set or anywhere else the market identifier, without additional information, is used.

MarketIDList

Container element for one or more individual MarketID elements.

Aggregations

MarketID	Required, multiples allowed
----------	-----------------------------

MarketID

Element just for identifying a Market, without any additional information.

Attributes

marketCode	Required	rixmlenum: ISO10383MarketType
ISO 10383 Market Identifier Code (MIC) used to precisely identify the exchange upon which the security trades.		

Market wrapper – with full details

MarketList

Container element for one or more individual Market elements.

Aggregations

Market	Required, multiples allowed
--------	-----------------------------

Market

Used to identify a specific exchange, trading platform, regulated or non-regulated market or trade reporting facility by its ISO standard code.

Root element details

[Content added as the value of this element]	Optional	xs:string
The element value can optionally be used to supply the market name associated with the standard code for human readability and convenience.		

Attributes

marketCode	Optional	rixmlenum:ISO10383ExchangeType
ISO 10383 Market Identifier Code (MIC) used to precisely identify the specific market.		

Tags related to region

Region wrapper – with just region identifiers

Used in the Focus tag set or anywhere else the region identifier, without additional information, is used.

RegionIDList

Container element for one or more individual RegionID elements.

Aggregations

RegionID	Required, multiples allowed
----------	-----------------------------

RegionID

Element just for identifying a Region, without any additional information.

Attributes

region	Required	rixmlenum:RegionEnum
regionPublisherDefinedValue	Optional	xs:string

Region wrapper – with full details

RegionList

Container element for one or more individual Region elements.

Aggregations

Region	Required, multiples allowed
--------	-----------------------------

Region

Indicates a region discussed in the product.

Attributes

isEmerging	Optional	xs:boolean
Indicates whether this Region is defined by the publisher as an emerging market.		
region	Required	rixmlenum:RegionEnum
regionPublisherDefinedValue	Optional	xs:string
sequence	Optional	xs:positiveInteger
If there are multiple elements specified, and they should appear in a certain order when the content is published, indicate the desired order by associating an appropriate sequence number to each one.		
isPrimary	Required	xs:boolean
Indicates the primary element when more than one are specified.		
coverageAction	Optional	rixmlenum:CoverageActionEnum
Highlights an action taken by the publisher. Indicates that the publisher is changing the coverage status of a Security. Example: a publisher initiates coverage of Security ABC.		
ratingAction	Optional	rixmlenum:RatingActionEnum
Highlights an action taken by the publisher. Indicates that the publisher is changing their rating on a Security. Example: a publisher downgrades Security ABC.		
weightingAction	Optional	rixmlenum:WeightingActionEnum

Highlights an action taken by the publisher. Indicates that the publisher is changing the weighting of the security type.

tagSource

Optional

xs:string

In the case of an automated tag, this tagSource attribute would hold a free-form text value indicating the publisher's name for the tagging method applied when not explicit (selected by an author or editor).

tagConfidence

Optional

xs:decimal

In the case of an automated tag, this tagConfidence attribute would hold a number between zero and one, with one representing perfect high confidence.

Aggregations

RatingList

Optional

WeightingList

Optional

Tags related to subject

SubjectList

Container element for one or more individual Subject elements.

Aggregations

Subject	Required, multiples allowed
---------	-----------------------------

Subject

Strongly recommended. Indicates a subject, or sub-topic, of the product. There is a standard set of subjects defined by RIXML including market opening comments, accounting and tax policy, and earnings surprise. If these do not fully represent the subject, the publisher may use a publisher defined subject value.

Attributes

subject	Required	rixmlenum:SubjectEnum
A subject, or sub-topic, discussed in this ResearchProduct.		
subjectPublisherDefinedValue	Optional	xs:string
If the subject = PublisherDefined, then the publisher can indicate a subject not in the SubjectEnum list.		
tagSource	Optional	xs:string
In the case of an automated tag, this tagSource attribute would hold a free-form text value indicating the publisher's name for the tagging method applied when not explicit (selected by an author or editor).		
tagConfidence	Optional	xs:decimal
In the case of an automated tag, this tagConfidence attribute would hold a number between zero and one, with one representing perfect high confidence.		

Making connections

What's the same / what's different

- V3.0 retains the *RelatedProduct* tag set, allowing publishers to indicate a connection from one research item to the next; this tag set has been enhanced to add the ability to indicate a particular IssuerID and/or SecurityID as being the issuer or security that connects the two research items.
- V3.0 introduces the ability to indicate that a research item is part of a series, provide information about the episode and the series, and to collect the list of episodes using the new Series Inventory Standard. This document contains information about the tag sets that are available within the Research Standard; the documentation for the Series Inventory Standard will be available separately in the near future.

Connecting the episodes in a series

Episode information wrapper

EpisodeList

Container element for one or more individual Episode elements.

Aggregations

Episode	Required, multiples allowed
---------	-----------------------------

Episode

Element describing a single Episode that is part of a larger Series product.

Attributes

episode	Optional	xs:string
Episode designation. Can be any name, such as E1 or E001.		
season	Optional	xs:string
Season designation. Can be any name, such as S1 or S001.		
episodeOrdinal	Optional	xs:positiveInteger
Indicates the ordinal number (i.e. numeric index) of the Episode within its season.		
episodeGlobalOrdinal	Optional	xs:positiveInteger
Indicates the ordinal number (i.e. numeric index) of the Episode overall in the Series, across seasons.		
year	Optional	xs:gYear
The year designation for an Episode published annually. For example, an annual REVIEW episode might be published in January 2024, but it would really be the 2023 REVIEW. This attribute can be used to tag this Episode as the 2023 piece in spite of its actual publication date.		
quarter	Optional	rixmlenum:QuarterEnum
The quarter designation for an Episode published quarterly. For example, a quarterly REVIEW episode might be published in October, but it would really be the Q3 REVIEW. This attribute can be used to tag this Episode as the Q3 piece in spite of its actual publication date.		
yearmonth	Optional	xs:gYearMonth
The year and month designation for an Episode published monthly. For example, a monthly REVIEW episode might be published in early June 2023, but it would really be the May 2023 REVIEW. This attribute can be used to tag this Episode as the May 2023 piece in spite of its actual publication date.		
month	Optional	xs:gMonth
The month designation for an Episode published monthly. For example, a monthly REVIEW episode might be published in early June, but it would really be the May REVIEW. This attribute can be used to tag this Episode as the May piece in spite of its actual publication date.		

week	Optional	xmlns:WeekOfYearEnum
The week-of-year designation for an Episode published weekly. For example, a weekly REVIEW episode might be published early in week W4 of the year, but it would really be the W3 REVIEW. This attribute can be used to tag this Episode as the W3 piece in spite of its actual publication		

date	Optional	xs:date
The date designation for an Episode. To be used in cases where the Episodes are meant to be tagged to specific dates that may not have perfectly aligned with the actual publication dates. For example, a late publication of a weekly Episode that always come out on Thursdays can be tagged to the proper Thursday here, rather than, say, the Friday on which it was actually published.		

Aggregations

Series	Required
---------------	-----------------

Contained within Episode: Series information

The Series tag set is used in the Research Standard (within the Episode tag set) and in the Series Inventory standard. Note that the authorship information within the Series tag set is at the PersonGroup level, allowing each item in a series to have the person(s) or team(s) involved in its creation to be assigned; the name of the firm publishing the item and series is contained with the Organization tag set, which is used in both standards.

Series

Used for publications issued as a Series or periodical.

Elements

Periodicity	Optional	xmlns:PeriodicityEnum
Indicates the frequency with which the Episodes of the Series are published.		
SeriesName	Required	xs:string
Indicates the name of the Series.		
SeriesID	Optional	xs:string
Since the name of a series may change over its lifetime, the SeriesID can be used to uniquely identify it. This tag gives the publisher the opportunity to maintain continuity in the Series across name changes.		
SeriesDescription	Optional	xs:string
Longer-form description of the purpose of the series.		

Aggregations

SeriesOwner	Optional
--------------------	-----------------

Contained within Series: series owner

SeriesOwner

The PersonGroup primarily responsible for production of content in this Series.

Aggregations

PersonGroup	Required
--------------------	-----------------

Tags related to related products

The RelatedProduct wrapper

RelatedProductList

Container element for one or more individual RelatedProduct elements.

Aggregations

RelatedProduct	Required, multiples allowed
----------------	-----------------------------

RelatedProduct

Describes how content contained in this product is associated with other products, or how content in other products is associated with this one. Can have none or any number of relationships to other products.

Attributes

relatedProductID	Required	xs:string
The unique productID of the product to which this product is related (as stored in ResearchProduct.productID of the related document).		
relationshipType	Required	rixmlenum:ProductRelationshipType
Indicates the type of relationship between this product and another product.		

Elements

RelationshipDescription	Optional	xs:string
The description of the relationship between the current product and the other product to which it is related. Intended for additional descriptive detail not already covered by the relationshipType attribute.		
TargetLanguage	Optional	rixmlenum:ISO639LanguageType
For relationshipType of TranslationOf, this is the specific language to which the original ResearchProduct was translated.		

Aggregations

SecurityID	Optional
For relationshipTypes that call for a Security specifier (such as Model, IndustryReport, or InitiationReport) use a SecurityID.	
IssuerID	Optional
For relationshipTypes that call for an Issuer specifier (such as Model, IndustryReport, or InitiationReport) use an IssuerID.	

Describing components & individual resources

What's the same / what's different

- At long last, the Research Standard will have the ability to provide tagging to certain components of the research item! The purpose of the *ComponentList* and *Component* tag set is to allow sub-sections of a research item – charts, graphs, paragraphs, written or audio chapters, etc. – to be described at a high level.
- The *Component* tag set does not have the full set of tags available to describe a research item; rather, we provide a subset that allows a publisher to provide the tagging necessary to allow an individual component to be found and accessed. For example, if a multi-company research report appears in a search result, the *Component* tag set would allow the user to find the exact chart that compares two individual companies without needing to search through the entire research item.

The component wrapper

ComponentList

Container element for one or more individual Component elements.

Aggregations

Component	Required, multiples allowed
-----------	-----------------------------

Component

Element to describe a single Component published within this ResearchProduct.

Attributes

componentID A unique identifier for the Component instance.	Optional	xs:string
componentType Indicates the type of the Component.	Required	rixmlenum:ComponentTypeEnum
componentOrdinal Indicates the ordinal number (i.e. numeric index) of the Component within its type within this ResearchProduct. For example, if this is Chart #7, then the ordinal number would be 7.	Optional	xs:positiveInteger
componentGlobalOrdinal Indicates the ordinal number (i.e. numeric index) of the Component within this ResearchProduct, regardless of type. For example, if this is Chart #7, but Component #18 overall then the global ordinal number would be 18.	Optional	xs:positiveInteger
componentDirectURL Indicates a direct URL to the Component, within its ResearchProduct context, on the publishers platform.	Optional	xs:anyURI
componentWidthDimension Indicates the width dimension in pixels for Components that occupy a rectangular block of space within the ResearchProduct. Would typically apply to Components of type Image, Photograph, Chart, and potentially others.	Optional	xs:positiveInteger
componentHeightDimension Indicates the height dimension in pixels for Components that occupy a rectangular block of space within the ResearchProduct. Would typically apply to Components of type Image, Photograph, Chart, and potentially others.	Optional	xs:positiveInteger
componentTimeDuration Indicates the total time duration in hours, minutes, seconds for Components that require playback, such as those of type Audio and Video.	Optional	xs:duration

Elements

ComponentTitleList

Required

TitleListType

Container for one or more Title variations for the Component.

Aggregations

ComponentSourceLineList

Optional

Container for one or more ComponentSourceLine variations for the Component.

MediaChapterList

Optional

Container for one or more MediaChapter elements for Components that require media playback. This acts as a table of contents for Audio and Video Components.

ExpectedSearchTermList

Optional

Container for one or more ExpectedSearchTerm elements that apply to the Component.

ContextTagList

Optional

Container for one or more ContextTag elements that apply to the Component.

Subset of Component: Component source line

ComponentSourceLineList

Container element for one or more individual ComponentSourceLine elements.

Aggregations

ComponentSourceLine

Required, multiples allowed

ComponentSourceLine

Line of text providing information about the source of the information presented in the Component. Often takes on the character of a footnote.

Root element details

[Content added as the value of this element]

Required

xs:string

Attributes

language

Optional

rixmlenum:ISO639LanguageType

Indicates the human language in which the element value is expressed. Overrides the language attribute on the overall RIXML instance document for this element.

includesFormatCoding

Optional

xs:boolean

Indicates whether or not the value includes any format coding. Limited markup permitted - HTML code for paragraph, ordered lists and unordered lists with list items, bold, underline, and italics. Default is false.

audienceType

Optional

rixmlenum:AudienceTypeEnum

Indicates the target audience for this variation.

audienceTypePublisherDefinedValue

Optional

xs:string

Indicates the target audience for this variation, only when the audienceType attribute is set to PublisherDefined.

Subset of Component: the tags used to describe the component or individual resources (files/URLs)

ContextTagList

Container element for one or more individual ContextTag elements that can be used to provide finer-grained context tagging on Resources and Components.

Aggregations

ContextTag	Required, multiples allowed
-------------------	------------------------------------

ContextTag

The top-level tags apply to the ResearchProduct as a whole. With this ContextTag element, though, we identify a subset of the full context tagging capability for use within individual Resource elements and Component elements. In these cases, we want the subset of tags to be short and limited to the most important and useful ones, such as Issuer, Security, Industry, Region, Country, AssetClass, EsgDimension, and Author.

Aggregations

IssuerID	Optional, multiples allowed	
SecurityID	Optional, multiples allowed	
IndustryID	Optional, multiples allowed	
RegionID	Optional, multiples allowed	
CountryID	Optional, multiples allowed	
AssetClassID	Optional, multiples allowed	
EsgDimensionID	Optional, multiples allowed	
AuthorID	Optional, multiples allowed	PersonIDType

Subset of Component: the tags used to define media chapters

MediaChapterList

Container element for one or more individual MediaChapter elements that can be used as a table of contents for Components types that require playback.

Aggregations

MediaChapter	Required, multiples allowed
--------------	-----------------------------

MediaChapter

For Component types that require playback, such as Audio and Video, this MediaChapter element can be used as part of a table of contents that describes specific parts by start offset and title.

Aggregations

MediaChapterTitleList	Required	TitleListType
Container for one or more Title variations for the MediaChapter.		

Attributes

mediaChapterTimeDuration	Optional	xs:duration
Indicates the time duration of this MediaChapter. (Not the end time offset.)		
mediaChapterStartOffset	Required	xs:duration
Indicates the time offset at which this MediaChapter starts.		
mediaChapterOrdinal	Optional	xs:positiveInteger
Indicates the ordinal number (i.e. numeric index) of the MediaChapter within this Component. For example, if this is Chapter #7, then the ordinal number would be 7.		
mediaChapterID	Optional	xs:string
A unique identifier for the MediaChapter instance.		
mediaChapterDirectURL	Optional	xs:anyURI
Indicates a direct URL to the MediaChapter, within its ResearchProduct context, on the publishers platform.		

Ratings, Weightings, Estimates, and Actions

What's the same / what's different

- Ratings are now contained within a RatingList wrapper to enable multiples
- publisherDefinedValue has been renamed ratingPublisherDefinedValue
- Weightings are now contained within a WeightingList wrapper to enable multiples
- publisherDefinedValue has been renamed weightingPublisherDefinedValue
- Otherwise, the Rating and Weighting elements are largely unchanged
- In prior versions of the RIXML Standards Suite, coverage action, estimate action, rating action, and weighting action were attributes added to relevant Elements. These are now elements, each of which lives within its respective ...List wrapper element.
- v3.0 also introduces an ActionList wrapper element to contain the CoverageActionList, EstimateActionList, RatingActionList, and WeightingActionList tag set; the ActionList element is used in various places in the Research and Coverage Updates standards.

Tags related to ratings

Note that the tags related to a ratings **action** are found in the “action list” section, below.

The Rating wrapper

RatingList

Container element for one or more individual Rating elements.

Aggregations

Rating	Required, multiples allowed
--------	-----------------------------

Rating

This is information regarding ratings. These can be about the issuer of a security or a security itself, an industry, a country, or other entities.

Attributes

timeFrame	Optional	rixmlenum:TermEnum
This is the period for which the rating is relevant, as of the date it was established by the authoring entity.		
priorCurrent	Optional	rixmlenum:PriorCurrentTypeEnum
Used to indicate whether the rating is current or prior (current is the default). Prior is only used to give reference for a change from a prior rating. Prior is used to indicate what the prior figure was for the period specified in order to give context to the current figure, not to provide the figure for a prior time period.		
relationship	Optional	rixmlenum:RatingRelationshipEnum
Provides a context for the rating.		
volatile	Optional	xs:boolean
Indicates the volatility of the rated entity.		
volatilityRisk	Optional	rixmlenum:RatingVolatilityRiskEnum
An indication of the potential price fluctuation of the rated entity.		
rating	Required	rixmlenum:RatingEnum
The actual rating as issued by the authoring entity.		
ratingPublisherDefinedValue	Optional	xs:string
Used to specify the publisher's own rating expression when the rating attribute value is set to PublisherDefined.		

ratingDateTime	Optional	xs:dateTime
Permits tagging a rating with the publication date/time, in case it differs from the publication date/time of the research payload. It is expressed using ISO 8601 as refined by the World Wide Web Consortium's note http://www.w3.org/TR/NOTE-datetime . In addition, RIXML requires the use of Zulu time or Z-time (GMT +/- n hours:minute:seconds). All times are absolute and easier to compute, rather than using a relative (i.e. 08:30 +5) time.		
ratingType	Optional	rixmlenum:RatingTypeEnum
Permits tagging a rating with an additional type that provides more information about the meaning behind the rating.		
aspect	Optional	rixmlenum:RatingAspectEnum
Permits tagging a rating with the aspect of the rated entity addressed by the rating itself.		
ratingAction	Optional	rixmlenum:RatingActionEnum
Highlights an action taken by the publisher. Indicates that the publisher is changing their rating on the entity enclosing this Rating element. This is the preferred location for ratingAction specifiers, as opposed to within the corresponding attributes of the enclosing rated entity. In this manner, a ratingAction specifier applies to the rating element itself, permitting multiple ratings of the same entity to have independent corresponding actions.		

Aggregations

RatingEntity	Required	
Elements		
Description	Optional	xs:string
A description of the rating. May include time horizon.		

Contained within Rating: rating entity information

RatingEntity
The rating entity featured in the research item. This may be a publisher or an independent agency.

Attributes

ratingEntity	Required	rixmlenum:RatingEntityEnum
ratingEntityPublisherDefinedValue	Optional	xs:string
Used when the ratingEntity value is PublisherDefined.		

Tags related to weighting

What’s the same / what’s different

- Weightings are now contained within a WeightingList wrapper to enable multiples
- publisherDefinedValue has been renamed weightingPublisherDefinedValue
- Otherwise, the Weighting element is largely unchanged

Note that the tags related to a weighting **action** are found in the “action list” section, below.

WeightingList

Container element for one or more individual Weighting elements.

Aggregations

Weighting	Required, multiples allowed
-----------	-----------------------------

Weighting

This is information regarding weightings. These can be about the country, region, asset type, or other entities.

Attributes

timeFrame	Optional	rixmlenum:TermEnum
This is the period for which the weighting is relevant, as of the date it was established by the authoring entity.		
priorCurrent	Optional	rixmlenum:PriorCurrentTypeEnum
Used to indicate whether the weighting is current or prior (current is the default). Prior is only used to give reference for a change from a prior weighting. Prior is used to indicate what the prior figure was for the period specified in order to give context to the current figure, not to provide the figure for a prior time period.		
weighting	Required	rixmlenum:WeightingEnum
The actual weighting as issued by the authoring entity.		
weightingPublisherDefinedValue	Optional	xs:string
Used to specify the publisher's own weighting expression when the weighting attribute value is set to PublisherDefined.		

Elements

Description	Optional	xs:string
A description of the weighting. May include time horizon.		

Tags related to action list information

What's the same / what's different

- In prior versions of the RIXML Standards Suite, coverage action, estimate action, rating action, and weighting action were attributes added to relevant Elements. These are now elements, each of which lives within its respective ...List wrapper element.
- V3.0 also introduces an *ActionList* wrapper element to contain the *CoverageActionList*, *EstimateActionList*, *RatingActionList*, and *WeightingActionList* tag set; the *ActionList* element is used in various places in the Research and Coverage Updates standards.

The overall Action wrapper element

ActionList

Container element for zero or more finer-grained ActionList elements.

Aggregations

WeightingActionList	Optional
RatingActionList	Optional
EstimateActionList	Optional
CoverageActionList	Optional

Contained within ActionList: coverage action information

CoverageActionList

Container element for one or more individual CoverageAction elements.

Aggregations

CoverageAction	Required, multiples allowed
----------------	-----------------------------

CoverageAction

Describes a coverage action, indicating a change in coverage announced in this ResearchProduct.

Attributes

coverageAction	Required	rixmlenum:CoverageActionEnum
Indicates the specific type of coverage action, such as Initiate or Drop, that applies to all the listed targets.		

Aggregations

IssuerIDList	Optional
SecurityIDList	Optional
IndustryIDList	Optional
CountryIDList	Optional
RegionIDList	Optional

Contained within ActionList: estimate action information

EstimateActionList

Container element for one or more individual EstimateAction elements.

Aggregations

EstimateAction	Required, multiples allowed
----------------	-----------------------------

EstimateAction

Describes a estimate action, indicating a change in estimate announced in this ResearchProduct.

Attributes

estimateAction	Required	rixmlenum:EstimateActionEnum
Indicates the specific type of estimate action, such as Upgrade or Downgrade, that applies to all the listed targets.		

Aggregations

SecurityIDList	Optional
----------------	----------

Contained within ActionList: rating action information

RatingActionList

Container element for one or more individual RatingAction elements.

Aggregations

RatingAction	Required, multiples allowed
--------------	-----------------------------

RatingAction

Describes a rating action, indicating a change in rating announced in this ResearchProduct.

Attributes

ratingAction	Required	rixmlenum:RatingActionEnum
Indicates the specific type of rating action, such as Upgrade or Downgrade, that applies to all the listed targets.		

Aggregations

IssuerIDList	Optional
SecurityIDList	Optional
IndustryIDList	Optional
CountryIDList	Optional
RegionIDList	Optional

Contained within ActionList: weighting action information

Note that WeightingAction includes the ability to add weighting information for asset classes and ESG dimensions in addition to the options available in coverage and rating.

WeightingActionList

Container element for one or more individual WeightingAction elements.

Aggregations

WeightingAction	Required, multiples allowed
-----------------	-----------------------------

WeightingAction

Describes a weighting action, indicating a change in weighting announced in this ResearchProduct.

Aggregations

IssuerIDList	Optional
SecurityIDList	Optional
IndustryIDList	Optional
CountryIDList	Optional
RegionIDList	Optional
AssetClassIDList	Optional
EsgDimensionIDList	Optional

Attributes

weightingAction	Required	rixmlenum:WeightingActionEnum
Indicates the specific type of weighting action, such as Increase or Decrease, that applies to all the listed targets.		

Special-use tags

There are some tag sets used within the standards that are either used in many places or are only used in particular circumstances. Because these tags do not fit neatly into the prior chapters, we are collecting them here.

Tags related to financial information

What's the same / what's different

- Within the FinancialValue tag set, the EstimateEnum has been renamed EstimateActionEnum; the FinancialValue tag set now lives within a FinancialValueList wrapper, allowing for multiple instances of this tag; tags formerly using RIXML YesNo tag now use xs:Boolean; and the currency information is now housed in a CurrencyType tag set.
- As in prior versions, financial information is communicated through the FinancialsType tag set, which is used in both the Issuer and the Security tag sets.

Financial dates

FinancialDates

Relevant dates related to Issuer and/or Security financial data.

Attributes

lastReportedPeriod	Optional	rixmlenum:PeriodEnum
Used together with lastReportedYear to indicate the period when the financials were last reported. For example, Q1 2000.		
lastReportedYear	Optional	xs:integer
Used together with lastReportedPeriod to indicate the period when the financials were last reported. For example, Q1 2000.		
reportingDate	Optional	xs:dateTime
Represents the date the numbers were actually published. Expressed using ISO 8601 (as refined by the World Wide Web Consortium's note http://www.w3.org/TR/NOTE-datetime). In addition, RIXML requires the use of Zulu time or Z-time (GMT +/- n hours:minute:seconds). All times are absolute and easier to compute, rather than using a relative (i.e. 08:30 +5) time.		

Contained within Financials: financial values

FinancialValueList

Container element for one or more individual FinancialValue elements.

Aggregations

FinancialValue	Required, multiples allowed
----------------	-----------------------------

FinancialValue

Stores a specific financial data item for an issuer or a security.

Root element details

[Content added as the value of this element]	Required	xs:string
--	----------	-----------

Attributes

estimateActual Indicates whether a financial figure is actual or estimated.	Required	rixmlenum:EstimateActualEnum
period Used together with periodYear and periodEnd to indicate the applicable period for a financial value. Example: Q4 2000 ending 31 December.	Optional	rixmlenum:PeriodEnum
periodEnd Used together with period and periodYear to indicate the applicable period for a financial value. Example: Q4 2000 ending 31 December.	Optional	xs:dateTime
periodYear The four-digit year used together with period and periodEnd to indicate the applicable period for a financial value. Example: Q4 2000 ending 31 December.	Optional	xs:integer
duration Time duration that is being addressed.	Optional	xs:duration
dateTime Exact date and time applicable to a financial data item, expressed using ISO 8601 (as refined by the World Wide Web Consortium's note http://www.w3.org/TR/NOTE-datetime). In addition, RIXML requires the use of Zulu time or Z-time (GMT +/- n hours:minute:seconds). All times are absolute and easier to compute, rather than using a relative (i.e. 08:30 +5) time. Generally dateTime is used instead of period, periodYear and periodEnd when a specific date can be assigned to a financial data item, for example, Total Assets as of 31 January 2000.	Optional	xs:dateTime
estimateAction If this financial value is an estimate, the estimateAction attribute can be used to indicate an action, such as reiterate or upgrade, that applies to this estimate. Intended to provide support for the case where an author is including more than one estimate action in the same report -- for example, reiterating the current fiscal year estimate and upgrading the next fiscal year estimate.	Optional	rixmlenum:EstimateActionEnum

Increasing findability via Expected Search Terms

What's the same / what's different

- The Keyword and KeywordClassifications have been renamed ExpectedSearchTerm and ExpectedSearchTermList.
- ExpectedSearchTerms can now indicate the language.

ExpectedSearchTermList

Container element for one or more individual ExpectedSearchTerm elements.

Aggregations

ExpectedSearchTerm	Required, multiples allowed
--------------------	-----------------------------

ExpectedSearchTerm

In order to improve discoverability of content for which the most likely search terms are not in any existing enumerations, this ExpectedSearchTerm element gives publishers the opportunity to anticipate how consumers will try to find this content and specify free-form terms that best mate with the ResearchProduct or Component. Each ExpectedSearchTerm represents a compound term (single or multi-word term).

Root element details

[Content added as the value of this element]	Required	xs:string
Attributes		
language	Optional	rixmlenum:ISO639LanguageType
Indicates the human language in which the element value is expressed. Overrides the language attribute on the overall RIXML instance document for this element.		

Tags related to event information

What's the same / what's different

- We recommend use of the Interactions standard for capturing event details; however, we are retaining this tag set in v3.0 at the request of a member firm, as removing it would pose a significant challenge at this point. This tag set remains largely the same as in v2.5.

Event wrapper

EventDetails

Provides the necessary information when the Product is actually describing an event.

Elements		
EventType	Required	rixmlenum:EventTypeEnum
EventSponsor	Required	rixmlenum:OrganizationTypeEnum
Aggregations		
EventVenue	Optional	
EventHost	Optional	
RegistrationInformation	Optional	
ContactInfoList	Optional	

Contained within Event: event venue

EventVenue

Indicates the venue -- can be physical (one-on-one meeting) or virtual (conference call or webcast). Strongly recommended for a location-based event. Required when ResearchProduct.isEvent=True or ResearchProduct.FormList.Form.form=Event.

Aggregations		
OrganizationList	Optional	
EventDateList	Optional	
EntitlementList	Optional	
ContactInfoList	Optional	
Attributes		
type	Required	rixmlenum:EventVenueTypeEnum

Contained within Event: event host

EventHost

Describes the organization(s) hosting the event. Multiple hosts of one event are possible. However, there can be only one primary host, which is captured by the Organization isPrimary setting.

Aggregations		
OrganizationList	Required	

Contained within Event: registration information

RegistrationInformation

Registration information relating to an event.

Aggregations

OrganizationList	Optional
------------------	----------

Contained within Event Venue: dates related to the event

EventDateList

Container element for one or more individual EventDate elements.

Aggregations

EventDate	Required, multiples allowed
-----------	-----------------------------

EventDate

Describes a date/time relevant to the event, and relative to the type attribute. It is expressed using ISO 8601 as refined by the World Wide Web Consortium's note <http://www.w3.org/TR/NOTE-datetime>. In addition, RIXML requires the use of Zulu time or Z-time (GMT +/- n hours:minute:seconds). All times are absolute and easier to compute, rather than using a relative (i.e. 08:30 +5) time.

Root element details

[Content added as the value of this element]	Required	xs:string
--	----------	-----------

Attributes

type	Required	rixmlenum:EventDateTypeEnum
------	----------	-----------------------------

Describes the relevance of the date/time to the event.

Tags related to specialty

The Specialty wrapper

SpecialtyList

Container element for one or more individual Specialty elements.

Aggregations

Specialty	Required, multiples allowed
-----------	-----------------------------

Specialty

Area of specialty associated with an organization that publishes research.

Attributes

specialty	Required	rixmlenum:SpecialtyEnum
-----------	----------	-------------------------

Contained within Specialty: publishing language

PublishingLanguageList

Container element for one or more individual PublishingLanguage elements..

Aggregations

PublishingLanguage	Required, multiples allowed
--------------------	-----------------------------

PublishingLanguage

A specific language in which an organization publishes research with some frequency and fluency.

Attributes

publishingLanguage	Required	rixmlenum:ISO639LanguageType
Restricted by ISO 639 standard.		

Appendix: Named Types

Named type: PersonIDType

The PersonIDType is defined as a named type in the RIXML standards to facilitate its reuse as the AuthorID attached to individual components within a research item in addition to being used here within the Person element. The expectation is that the full person/author information – including name and unique ID - will be provided within the Person element, then the uniqueID will be provided in the AuthorID in the component area to indicate the authorship of the individual component (when desired).

PersonIDType

Root element details

[Content added as the value of this element]	Required	xs:string
The full display name of the Person can be added here for human readability and convenience, but the personID attribute is the actual identifier.		

Attributes

personID	Required	xs:string
For accurate identification it is required that the personID be unique for a given publisher, but the implementation of the ID is left to the publishers to implement as they deem fit. Examples: combination of LastName and FirstName, combination of internal employee ID and RIXML publisher ID. GUID recommended.		

Named type: TitleList

TitleList is defined by theTitleListType named type, because it is used in multiple places in the Research standard:

- as described in the paragraph above, a RIXML Research file may contain references to more than one associated files or research items (called *Resources*); in this case, the main Research record will have a TitleList tag set (shown in the following section)
- The ComponentTitleList, which contains the titles of one or more components within a research item, also used this named type
- The MediaChapterTitleList, which contains the titles of one or more chapters within a research item, also uses this named type

TitleListType

Container type for one or more individual Title elements.

Aggregations

Title	Required, multiples allowed
-------	-----------------------------

Named type: FinancialsType

FinancialsType

Attributes

gaapType	Optional	rixmlenum:FinancialStatementGAAPTypeEnum
Generally Accepted Accounting Principles.		
restated	Optional	xs:boolean
To state in a new form a company's financial statements, perhaps to reflect a current period item back through prior periods.		

proForma	Optional	xs:boolean
A hypothetical financial model based on a set of assumptions.		
financialsTypePublisherDefinedValue	Optional	xs:string
displayName	Optional	xs:string
If a publisher-defined value, or a value defined by RIXML but the publisher wishes to call the value by another name (e.g., Turnover instead of Sales), this attribute should be used to provide the desired value name.		
yearType	Optional	rixmlenum:YearTypeEnum
Indicates whether the year specified is a fiscal year or calendar year		
priorCurrent	Optional	rixmlenum:PriorCurrentTypeEnum
Indicates whether the financials are current or prior. Defaulted to currentPrior is used to indicate what the prior figure was for the period specified in order to give context to the current figure, not to provide the figure for a prior time period.		

Elements

Source	Optional	xs:string
Free-text tag to indicate the source of the numbers. Example: the name of the company that provides the consensus figures.		

Aggregations

Currency	Optional	
Indicates the currency of the issuer financials.		
FinancialValueList	Required	

Named type: IndustryIDListType

IndustryIDListType
Container type for one or more individual IndustryID elements.

Aggregations

IndustryID	Required, multiples allowed
-------------------	------------------------------------

Named type: AssetClassIDListType

AssetClassIDListType
Container type for one or more individual AssetClassID elements.

Aggregations

AssetClassID	
---------------------	--

Named type: ESGDimensionIDListType

EsgDimensionIDListType
Container type for one or more individual EsgDimensionID elements.

Aggregations

EsgDimensionID	Required, multiples allowed
-----------------------	------------------------------------

Appendix: Attribute Groups

A note about attribute groups

To improve efficiency in the XSD files, we have employed the use of attribute groups for certain sets of attributes, as listed here. Because any actual RIXML record will have the relevant individual attributes contained within an attribute group, the name of the attribute group will never actually appear in an RIXML instance file (the tagging file that travels along with a research item). We are listing the 6 attribute groups and the attributes each contains here; however, in the documentation, we list the attributes out separately rather than simply listing the name of the attribute group. We feel that readers of this documentation would prefer to see the list of attributes along with the other attributes, rather than being forced to look for the information elsewhere in the documentation.

actionAttributeGroup

AttributeGroup for rating, coverage and weighting actions

Attributes

ratingAction	Optional	rixmlenum:RatingActionEnum
Highlights an action taken by the publisher. Indicates that the publisher is changing their rating on a Security. Example: a publisher downgrades Security ABC.		
coverageAction	Optional	rixmlenum:CoverageActionEnum
Highlights an action taken by the publisher. Indicates that the publisher is changing the coverage status of a Security. Example: a publisher initiates coverage of Security ABC.		

Attribute groups

weightingAttributeGroup	Optional
--------------------------------	-----------------

automatedTaggingAttributeGroup

AttributeGroup for elements that could be automatically populated, such as via some kind of Artificial Intelligence (AI) model. These attributes will help publishers to distinguish between explicit tagging and automated tagging.

Attributes

tagSource	Optional	xs:string
In the case of an automated tag, this tagSource attribute would hold a free-form text value indicating the publisher's name for the tagging method applied when not explicit (selected by an author or editor).		
tagConfidence	Optional	xs:decimal
In the case of an automated tag, this tagConfidence attribute would hold a number between zero and one, with one representing perfect high confidence.		

episodeAttributeGroup

AttributeGroup for Episode elements. Note that attributes for year, quarter, yearmonth, and month, week, and date would commonly be derivable from the publication date of the ResearchProduct. However, in some cases, publication of an Episode might lag the time period it discusses. These attributes can be used to override the publication date when presented to consumers in the context of the Series.

Attributes

episode	Optional	xs:string
Episode designation. Can be any name, such as E1 or E001.		
season	Optional	xs:string
Season designation. Can be any name, such as S1 or S001.		
episodeOrdinal	Optional	xs:positiveInteger
Indicates the ordinal number (i.e. numeric index) of the Episode within its season.		
episodeGlobalOrdinal	Optional	xs:positiveInteger
Indicates the ordinal number (i.e. numeric index) of the Episode overall in the Series, across seasons.		
year	Optional	xs:gYear
The year designation for an Episode published annually. For example, an annual REVIEW episode might be published in January 2024, but it would really be the 2023 REVIEW. This attribute can be used to tag this Episode as the 2023 piece in spite of its actual publication date.		
quarter	Optional	rixmlenum:QuarterEnum
The quarter designation for an Episode published quarterly. For example, a quarterly REVIEW episode might be published in October, but it would really be the Q3 REVIEW. This attribute can be used to tag this Episode as the Q3 piece in spite of its actual publication date.		
yearmonth	Optional	xs:gYearMonth
The year and month designation for an Episode published monthly. For example, a monthly REVIEW episode might be published in early June 2023, but it would really be the May 2023 REVIEW. This attribute can be used to tag this Episode as the May 2023 piece in spite of its actual publication date.		
month	Optional	xs:gMonth
The month designation for an Episode published monthly. For example, a monthly REVIEW episode might be published in early June, but it would really be the May REVIEW. This attribute can be used to tag this Episode as the May piece in spite of its actual publication date.		
week	Optional	rixmlenum:WeekOfYearEnum
The week-of-year designation for an Episode published weekly. For example, a weekly REVIEW episode might be published early in week W4 of the year, but it would really be the W3 REVIEW. This attribute can be used to tag this Episode as the W3 piece in spite of its actual publication		
date	Optional	xs:date
The date designation for an Episode. To be used in cases where the Episodes are meant to be tagged to specific dates that may not have perfectly aligned with the actual publication dates. For example, a late publication of a weekly Episode that always come out on Thursdays can be tagged to the proper Thursday here, rather than, say, the Friday on which it was actually published.		

sequencingAttributeGroup

AttributeGroup for the isPrimary and sequence attributes used to indicate an order of individual elements when multiple are present.

Attributes

sequence	Optional	xs:positiveInteger
If there are multiple elements specified, and they should appear in a certain order when the content is published, indicate the desired order by associating an appropriate sequence number to each one.		
isPrimary	Required	xs:boolean
Indicates the primary element when more than one are specified.		

titleAttributeGroup

(note: this has been added to title, subtitle, abstract, and synopsis but NOT to file title yet)

Attributes

language	Optional	rixmlenum:ISO639LanguageType
Indicates the human language in which the element value is expressed. Overrides the language attribute on the overall RIXML instance document for this element.		
includesFormatCoding	Optional	xs:boolean
Indicates whether or not the value includes any format coding. Limited markup permitted - HTML code for paragraph, ordered lists and unordered lists with list items, bold, underline, and italics. Default is false.		
audienceType	Optional	rixmlenum:AudienceTypeEnum
Indicates the target audience for this variation.		
audienceTypePublisherDefinedValue	Optional	xs:string
Indicates the target audience for this variation, only when the audienceType attribute is set to PublisherDefined.		

weightingAttributeGroup

Attribute group for weighting action alone

Attributes

weightingAction	Optional	rixmlenum:WeightingActionEnum
Highlights an action taken by the publisher. Indicates that the publisher is changing the weighting of the security type.
