

RIXML.org

RIXML Research Standard v3.0

June 16, 2022

RIXML Quarterly Meeting

Goals

Cleanup

- Better integrate enhancements made in the v2.x series that were implemented with backward-compatibility in mind
- Remove elements of the schema not used by adopters

Enhance

- Respond to the evolving publishing space by better covering topics such as linkbacks, audio/video content, and episodic content
- Respond to emerging topics such as ESG, blockchain, cryptocurrency, and cannabis

Explain

- Improve how we use object diagrams in our documentation
- Unify terminology definitions across schema and documentation
- Capture and incorporate more recent best practices

Structure

Administrative Track

- Develop timeline
- Assemble teams
- Convene meetings
- Report on progress
- Coordinate feedback
- Update website (NEW)
- Plan and execute marketing strategy

Documentation Track

- Ensure definitions exist for all tags and tag sets
- Ensure definitions are stored within design tool
- Revise & enhance best practice guidance, implementation guidance, etc.
- Create cohesive documentation that contains definitions, object diagrams, and implementation and best practice content

Development Track

Toolbox

- Determine required tools
- Schema design tool
- Object diagramming tool
- Documentation extraction tool
- Project management tool

Cleanup

- Evaluate current standards
- Identify tags to be retired
- Identify past design compromises made to maintain backward-compatibility and simplify
- Identify and adjust areas that industry has outgrown
- Review & update enumeration lists

Enhancements

- Review backlog of change requests
- Incorporate findings on Topics
- Gather input from RIXML community

Topics

Research

Interactions

ESG

Linkbacks

Entitlements

Sector/Industry Classification

Interactive Content

Audio/Video Content

Episodic Content

Unstructured Data & AI

Entitlements & Subscriptions

Blockchain & Cryptocurrency

Cannabis

Schema

- Develop updated set of schema files
- Test and validate

Progress

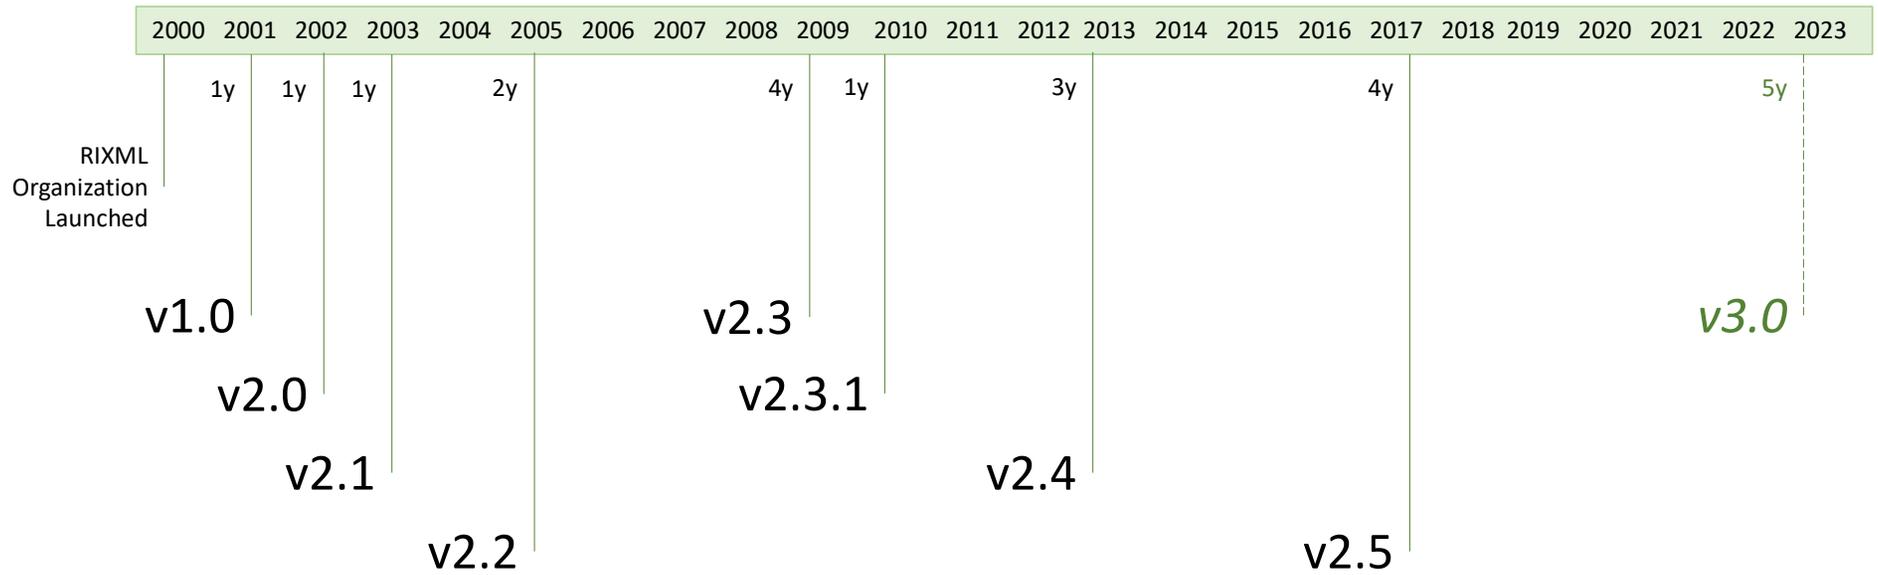

Plan

Phase 1: Planning and outreach	Phase 2: Scoping	Phase 3: Development	Phase 4: Testing and validating	Phase 5: Public release
Gathering requests; encouraging participation	Discussing requests & defining scope; determining major milestones and target deadlines	Incorporating changes into Standards Suite and updating documentation	Community testing and feedback	New version of Standards Suite becomes available

Actual

40%	30%				
Target Dates	July 29	August 31	November 18	February 28	March 31

History

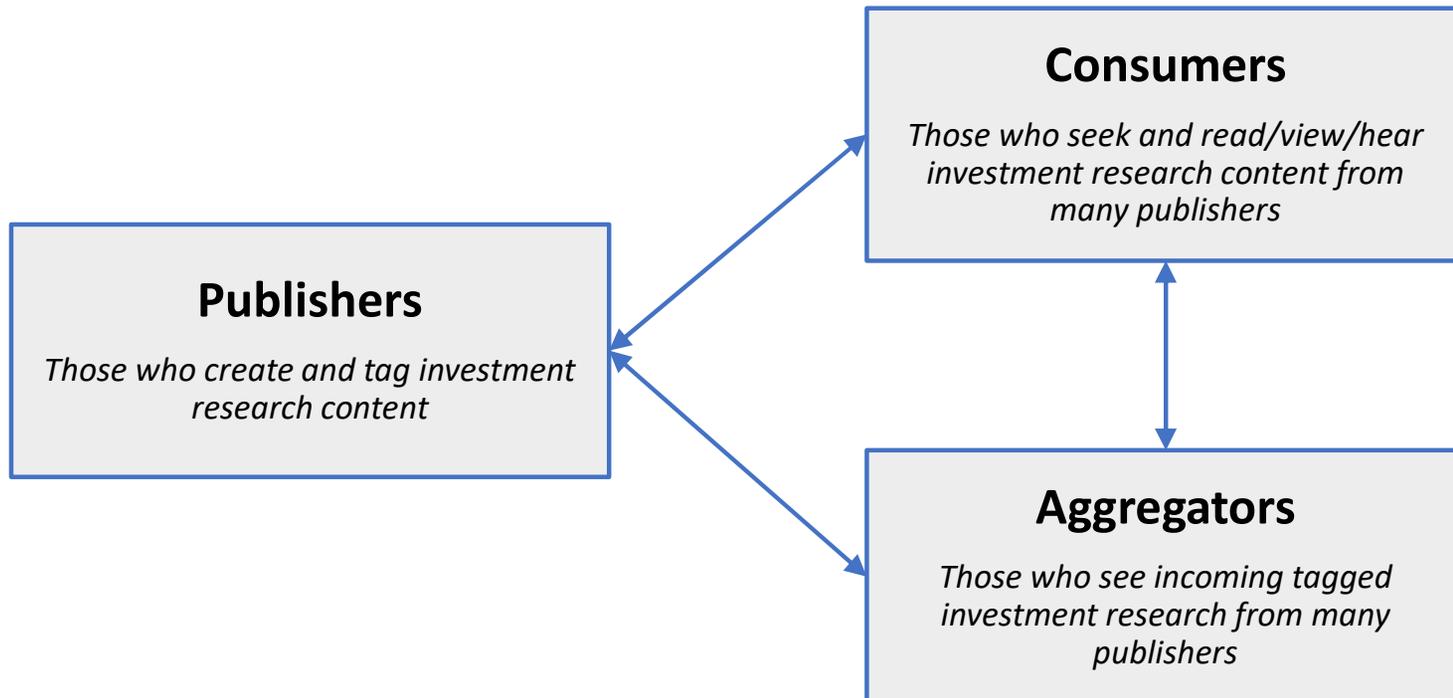

RIXML Research Standard
Production Releases

How has the research landscape changed?

- Since we released v2.5 of the Research Standard in 2017
- Since we launched the organization in 2000

Voices

Publishers

Which RIXML tags from the v2.x series do you **never** supply in your tagging? Or very rarely supply?

What **publisher-defined** tag values are you using most frequently that could be added to v3.0?

What information are your production processes capturing and storing outside RIXML that you would like to see **added** to v3.0?

Who at your firm should RIXML consult during the **outreach** phase the v3.0 cycle?

Consumers

What research content do you find most difficult to **search** for? What kinds of search terms are usually ineffective?

What are some other sources of **friction** in getting to the research content you need when you need it?

How would you like to see search **results**? What useful information could be added to the typical "*list of headlines*" presentation of results?

Who at your firm should RIXML consult during the **outreach** phase the v3.0 cycle?

Aggregators

Which RIXML tags from the v2.x series are **never** supplied by publishers? Or very rarely supplied?

What information missing in v2.x would you like see **added** in v3.0?

Which RIXML tags from the v2.x series are **not used** on your client-facing platform(s)?

Who at your firm should RIXML consult during the **outreach** phase the v3.0 cycle?

Everyone

How will research **content** evolve?
What will be the next formats, the
next categories?

What new **topics** will research
cover? What comes after ESG,
blockchain, cryptocurrency, etc.?

How will research **consumption**
evolve? What comes after PDF,
browser, and mobile apps?

What other tagging **standards** are
out there, established or emerging,
that RIXML should consider?

Example Ideas

Audio & Video Content

Thinking about audio & video content both embedded within a report and standalone

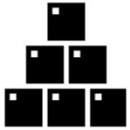

- Use-cases for embedded within a report vs. standalone, ad-hoc vs. episodic
- Calls for component-level tagging with context (authors, companies, etc.)
- Calls for indexing to specific time markers
- Perhaps new ProductCategoryEnums
 - *Podcast*
 - *Interview*
 - *PanelDiscussion*
 - *EventRecording*
 - *Marketing*
 - Any others?

Episodic Content

Research published on a regular schedule, such as a Periodical or Podcast, with sequential episodes

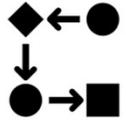

- Capturing episode identifiers, such as absolute episode number and/or episode within series
 - Should we expand on volume/number combination to also support year/week, year/month, year/quarter?
- Other descriptive data about the series
 - Longer-form description of the purpose of the series
 - Series Owner (Team or Individual)
 - Some context tags like Sector, Industry, AssetClass, Region, Country
- Expected search keywords for aiding discovery
- Inventory Check Schema for listing full catalog of episodes
- RIXML already supports
 - Product Series
 - Series Name
 - Series ID
 - Periodicity
 - Volume
 - Number

Component-Level Tagging

When components (charts, videos, etc.) are embedded within a specific report, should the RIXML include...

- **Component-Level Tags**
 - Title, Sub-Title, Source Line
 - Index within report (exhibit number, section number, time index)
 - Some kind of direct address or link?
- **Component-Level Context Tags**
 - Authors
 - Companies, Industries
 - Asset Classes
- **Component Catalog**
 - List of major sections
 - List of charts, tables, audios, videos

Related Content

Capturing how individual content items (reports, etc.) relate to others, such as derivations and follow-ups

- Company Report relates to latest Company Model
- Company Report relates to latest Industry Report
- Company Report relates to original Company Initiation Report
- Report in Japanese is a translation of same Report in English
- Economics Report references external Economic Dataset
- Podcast Video references original Annual Outlook report
- Could look like a kind of bibliography?
- Other cases?
- RIXML already supports
 - Based On
 - Part Of
 - References
 - Replaces
 - Requires
 - Translation Of
 - Related To
- By report IDs only

Resource-Level Context Tagging

Ability to mate specific payload files to local tags for author, company, industry, asset class, etc.

- Some publishers make more use of the multiple-payload support in RIXML
- No way to mark one as the Company ABC Model and the other as the Company XYZ Model
- No way to indicate if different payloads are associated with different authors
- A big cross-asset compendium report could have many payloads that call for context tagging
- How much should we support?
 - Author
 - Company
 - Sector/Industry
 - Asset Class
- How about also...
 - Translations
 - Alternative formats

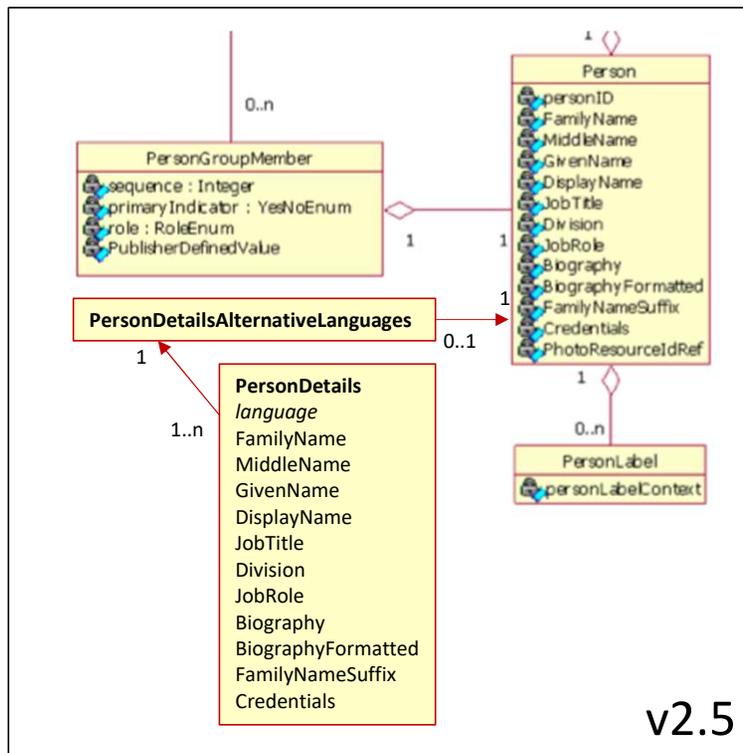

Tag Names in Multiple Languages

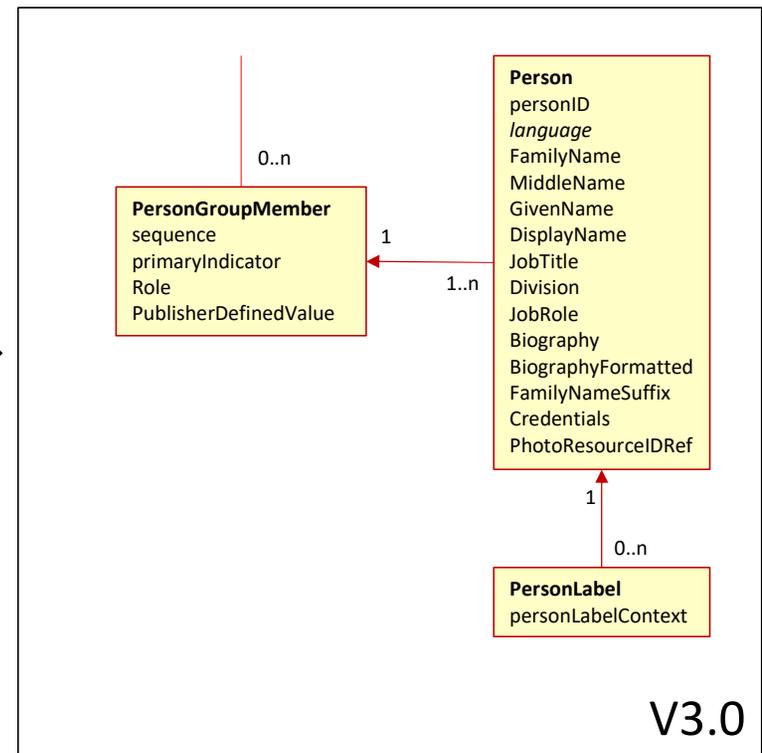

Simplify our v2.x design for supporting tag names in multiple languages

- Use proper *language* attribute within each relevant element combined with a more natural cardinality to establish peer relationship between language variants of the same element data
- This is simpler and better organized than the *AlternativeLanguages* construct built into v2.5
- Covers language support for
 - Person name
 - Person Group (Team) name
 - Title
 - Sub-Title
 - Synopsis
 - Abstract

Go from this...

To this

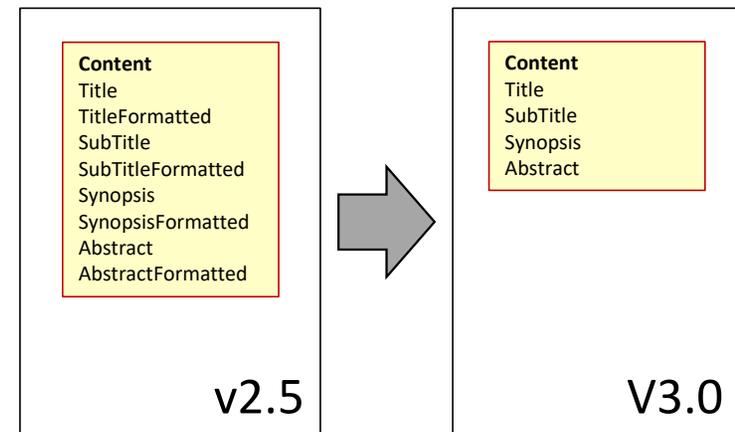

Unformatted Tags vs. Formatted

Simplify our v2.x design for supporting both unformatted and formatted tag names

- We currently support both unformatted and formatted variants for these elements below the Content element
 - Title
 - Sub-Title
 - Synopsis
 - Abstract
- A simpler and better organized alternative would be to have one set of these four sub-elements with a *formatted* attribute, rather than having a duplicate set of sub-elements for each variant

Remove Elements Not Adopted

Simplify our schema by removing parts of the design not adopted by the marketplace

- *Root element*
 - The Research element at the top of the schema was meant to include multiple Product elements (corresponding to reports)
- *Organization Expertise*
 - Does it make sense to keep this somewhat complex structure under the Organization element or perhaps spin it off into a Side-Car Schema?
- *Resource.Price*
 - Including pricing data in the report tagging file is probably not the best approach since it is subject to change
- *Certain Entitlement Types*
 - Is anyone using Country, Region, or Sector entitlements?
- *Events*
 - Does it make sense to keep this somewhat complex structure under the Context element or perhaps spin it off into a Side-Car Schema?

Asset Class Hierarchy

Simplify our schema by restructuring Asset Class, Asset Type, and Security Type into a real hierarchy

- We already have a documented hierarchy that structures the three Asset Class levels but do not implement them that way in the schema
- We present them as peers with no interdependencies
- Only in the documentation do we recommend awareness of the hierarchy
- Should we formalize this better in v3.0 so that validation of an instance document against the schema requires it?
- RIXML currently supports
 - Asset Class
 - Asset Type
 - Security Type
- But as independent peers
